What particles constitute the atom? How is atomic energy made manifest?

Discussed in STRANATHAN
THE "PARTICLES" OF MODERN PHYSICS

By J. D. STRANATHAN, Ph.D.
Professor and Chairman, Department of Physics, University of Kansas

218 Illus. 571 Pages. $4.00

Widely recognized as the most understandable presentation of the Principles and up-to-date conceptions of atomic structure and atomic energy, this book explains in a clear, intelligible way the various particles of which atoms are composed, and the different "rays" by which atomic energy is made evident.

Here one learns about protons, electrons, neutrons, mesotrons, positrons, x-rays, cosmic rays, etc.—how they were discovered and what role they play in atom-building and atom-disintegration, about fissions of uranium atoms and of the tremendous amounts of energy released in that process, how elements 93 and 94 were made by man. It presents an interesting and informative discussion of natural and artificial radioactivity, of isotopes, of transmutation of elements and of the machines by which these changes are brought about. It describes "tagged atoms" and how they serve as tracers in the human body to enable scientists to learn more about life processes.

The treatment throughout is refreshing and new and can be readily followed by the average student in general physics. A minimum of mathematics is included. Experimental evidence for the fundamental concepts is stressed and numerous references to original work are given in the literature. The book is essential to an appreciation of research being carried on in many fields.

### NEW CLEANSER SAVES LABOR

**Acts Fast...Does Better Work**

Actually lifts off hard-to-clean dirt. Use it for all cleaning jobs.

Avoid the fuss and expense of different cleansers for different jobs by using Alconox for all your cleaning. Here’s a concentrated wetting agent...not harsh...not a soap...that gets behind dirt...gets it off faster than anything you’ve ever tried! ALCONOX helps your workers do more cleaning in less time with better results. It leaves objects sparkling clean, without surface film or streaks. Toweling practically unnecessary. Saves money, too. A spoonful makes a gallon of active solution. Used by leading hospitals, food and industrial plants.

**3-lb. box, $1.25; carton of 12 boxes, $15.50; 50-lb. bag at 32¢ lb. f.o.b. New York.**

a steel microslide filing cabinet offering greater 45% capacity at amazingly low cost!

This new "LAB-AID" cabinet is the ultimate solution to the filing problems encountered in the laboratory. It is of welded-steel, fire-resistant construction throughout. Files 3"x1" or 3"x2" microslides, 2"x2" transparencies, large lantern slides, index cards, even paraffin blocks...in single-row drawers, all fitting interchangeably into a smooth-tracking master drawer-rail system. Unit-sections, assembled in any combination, can be used singly, or stacked to any convenient height. With all these advantages, the cost-per-slide capacity in the "LAB-AID" cabinet is the lowest ever. Investigate this remarkable equipment...the coupon will bring details.

The Technicon Company
215 East 149 Street
New York 51, N. Y.

Please send me details concerning your "LAB-AID" microslide filing cabinet.

In order to satisfy the clinical need for a uniform, potent, orally active digitalis preparation, a method was developed for producing adequate quantities of digitoxin (C$_{41}$H$_{64}$O$_{13}$), the most active glycoside obtained from Digitalis purpurea.

Pure crystalline digitoxin is now also available for laboratory use. It is supplied in hermetically sealed vials to allow for withdrawal of 20 mg. Directions for preparing stock solutions are furnished with each package.

GENERAL BIOCHEMICALS, INC.
DIVISION WYETH INCORPORATED
CHAGRIN FALLS, OHIO
ADVANTAGES IMPORTANT TO EVERY HOSPITAL...

The Pour-O-Vac seal is a practical hermetic closure which permits storage of sterile fluids for long periods. Sterility may be constantly determined by the audible "water-hammer" signal.

The flaring upper lip of the collar facilitates pouring solutions directly from the original container without danger of contamination by contact with parts of the collar which are not within the sterile area of the closure. Contents will pour freely and without drip.

Serves as an efficient dust-tight seal when total contents of container are not used. Eliminates waste of contents. Saves time in sealing. Eliminates use of cotton, gauze, string, paper, tape. Markedly reduces possibility of breakage or damage to lips of containers.

Cambridge, Massachusetts
25 YEARS AGO a Westinghouse research engineer started something that was destined to have a profound effect upon the lives of all of us... and upon generations yet unborn. That something was radio broadcasting.

Radio Broadcasting was born
on November 2, 1920, when the Presidential Election returns were broadcast from the tiny radio station, KDKA—built by Dr. Frank Conrad at the Westinghouse plant in East Pittsburgh, Pa. It was the first scheduled radio broadcast in history... the forerunner of a world-wide network that would eventually carry enlightenment and entertainment to the far corners of the earth.

Another "first" by Westinghouse was the use of radio waves to fuse a mirror-like finish on dull electrolytic tin plate. High-frequency induction heating now helps make one pound of war-scarce tin do the work of three.

Dielectric death
... administered to weevils in grain elevators... is another example of the ingenuity of Westinghouse high-frequency engineers. Westinghouse dielectric heating equipment is today speeding the bonding of plywood and curing of plastics and synthetic rubber.

Frequency modulation
was pioneered by Westinghouse scientists as far back as 1920. At that early time they experimented with high frequencies that led the way to the static-free, crystal-clear FM we know today.

Television
has become a reality because of the genius of Westinghouse micro-wave experts, who developed the forerunner of the Iconoscope in 1923 and the Kinescope in 1929. These devices banished forever cumbersome scanning discs.

Research in microwaves
never stops at Westinghouse. Research, begun 20 years ago, resulted in the key electronic tube for the first long-range Radar equipment. Other secret devices, born of war in the Westinghouse Research Laboratories, will contribute to a better, brighter peace-time world.

MEDICHROMES are 2 x 2" (35 mm.) Kodachrome lantern slides for teaching in the medical, nursing and biological sciences. They consist of photomicrographs, each of which is made as a direct photograph from the prepared microscope slide; clinical photographs; and gross photographs of specimens, all in full color.

INATTENTION is one of the obstacles to learning you’ll overcome when you use motion pictures as a teaching tool. With an authentic classroom film, you gain attention—hold it—accelerate learning.

Encyclopaedia Britannica Classroom Films and Silent Teaching Films are professionally created and teacher-tested. They are effectively integrated in the regular school curriculum with the Teacher’s Handbook which accompanies each film. Also, visual learning guides for classroom utilization of film content are available with many sound films.

There are many titles in the field of science. To name just a few:
- Electro-dynamics
- Home Electrical Appliances
- Simple Machines
- Light Waves and Their Uses
- Molecular Theory of Matter
- Work of Rivers
- Atmosphere and its Circulation

*Silent; others sound

Even with a small budget, your school can acquire a film library—now—through our new “Lease-to-Own” plan. No obligation beyond the budget year. Mail coupon today.

TEACHER’S HANDBOOK with every film

MEETING THE DEMANDS OF GLASS CHEMISTS

**MERCK**

Reagent Chemicals

Many tons of glass of various types are in daily use throughout the Merck plant at Rahway, N. J. Many chemical processes are possible only because the glass chemist has made available the many kinds of glass necessary for the success of such operations.

Regardless of type—lime soda glass, lead-containing glasses, chemical glassware, or optical glass—the glass chemist is called upon to devise formulas for batches, and to test raw materials as well as finished products.

To a large degree, he also must control durability, thermal expansion, elasticity, tensile strength, and many other physical properties.

We are proud that the exacting glass chemist uses Merck Analytical Reagents in making his rigid tests and analyses because, like the glass he has provided for use, they are of highest quality and dependability.

IF you are a maker of OPTICAL INSTRUMENTS of PRECISION you will be interested in FIRST-SURFACE mirrors from ITHACA. We make only one quality—the highest—under the names of CHROLUMINUM for opaque mirrors and DUOLUX for semi-reflecting ones. Our mirrors meet the highest specifications in respect to brilliance, hardness, and permanence. Whenever you have an instrument problem involving the reflection or partial transmission of light, think of EVAPORATED Metal Films at ITHACA.

Steam Heat only.

Castle REFLUX STILL
for pure distillation

The Castle Reflux Still produces approximately 10 gallons of pyrogen-free distillate per hour, with a greater degree of purity than any other standard apparatus or process. It is completely automatic and is constructed with evaporator for quick, easy cleaning when necessary.

The Castle Reflux Principle permits partial purification of the water even before it gets to the evaporating chamber. Overflow deconcentrating tube prevents concentration of solids in evaporator which has 27-inch height and baffle design to prevent contamination of condenser by foaming or splashing. It operates on the Reflux Principle in which the primary condenser returns one quarter of the vapor . . . particularly the larger particles . . . to the evaporator and only the finest vapor passes over to the secondary condenser producing the final condensate.

For further details of the Castle Reflux Still, write: Wilmot Castle Co., 1212 University Ave., Rochester 7, N. Y.
A universal Electro-Titrator using a highly stable and sensitive voltmeter circuit designed by Dr. R. L. Garman and Dr. M. E. Droz for determinations of end-points in electrometric neutralization titrations (including pH determinations), oxidation-reduction titrations, and precipitation titrations.

Some of its outstanding advantages are:

1. Variable sensitivity up to a maximum of 40 millivolts per inch of needle deflection.
2. Battery operated, uses as little as 0.25 watts; fluctuations in the power supply are completely eliminated.
3. Direct reading meter with 3½" linear scale permits continuous readings of voltage changes.
4. Compact, sturdy design.

Immediate Delivery

Used for control work and research work in leading laboratories throughout the country.

E. LEITZ, Inc., 304 Hudson St., New York 13, N. Y.

Graduate chemistry student at Ohio State University adjusts Speedomax Recorder before checking purity of propyne (CH₂ = CH) by infra-red spectrum. University connects own spectrometer, designed and built by Physics Dept., with Speedomax to form spectrograph.

“OHIO STATE” CHARTS INFRA-RED via SPEEDOMAX

In the Physics Dept. Laboratories of Ohio State University, as in many other labs, infra-red absorption measurements are now being recorded by means of a Speedomax high-speed Recorder. The Department has dispensed with hand-drawn curves of these measurements, because Speedomax records are so quickly and automatically obtained; so accurate and dependable.

The Speedomax is the L&N high-speed potentiometer recorder in which the balancing mechanism is electronically controlled. Its speed is such that the pen crosses the chart in about 1.5 seconds. To record infra-red absorption, the user has only to provide an amplifying link between the Recorder and the radiation receiver of his own spectrometer.

If you are interested in infra-red recording, an L&N engineer would be glad to discuss Speedomax as applied to your specific problem.

A CHALLENGE TO CIVILIZATION

By Dr. NIELS BOHR

The advance of physical science which has made it possible to release vast amounts of energy through atomic disintegration has initiated a veritable revolution of human resources, presenting civilization with a most serious challenge. Man's increasing mastery of the forces of nature, which has provided ever richer possibilities for the growth of culture, may indeed threaten to upset the balance vital for the thriving of organized communities, unless human society can adjust itself to the exigencies of the situation. The great technical developments of the last century already deeply affected the social structure of every country but, evidently, we have now reached a stage which calls for a new approach to the whole problem of international relationship.

The formidable means of destruction which have come within reach of man will obviously constitute a mortal menace to civilization unless, in due time, universal agreement can be obtained about appropriate measures to prevent any unwarranted use of the new energy sources. An agreement to this purpose will surely demand the abolition of barriers hitherto considered necessary to protect national interests but now standing in the way of common safety against unprecedented dangers. In fact, only international control of every undertaking which might constitute a danger to world security will in future permit any nation to strive for prosperity and cultural development without constant fear of disaster.

Whatever renunciations as regards customary prerogatives such regulation will involve, it should be clear to all that, in contrast to other issues where
