you needn't put up with "shoebox" block filing

Ask for a six-month-old paraffin block in many an otherwise well-ordered laboratory, and the hunt's on. Likely as not it means hours of prowling through a weird behind-the-scenes jumble of dusty, dog-eared cartons . . . trying everyone's temper, taking everyone's time, piling up hidden costs.

That's all out now, with this new "Lab-aid" block filing cabinet. You file your paraffin blocks in small, shipshape, white cardboard boxes, which come in varied sizes to accommodate all sorts of blocks, however irregular or out-sized. The boxes knock down, but spring to shape in a moment, so they're no storage problem. They're so proportioned that they fit snugly, row on row, in the shallow steel drawers.

The all-steel cabinet holds ten drawers, equipped with combination drawerpulls and label-holders at each end. Each drawer will accommodate a gross of the 1 1/2" boxes: other sizes in ratio (see the filled drawers above). Multiply that by ten and you've some idea of the large capacity of this compact section (it's only 19" square by 12" high). That's because there's no waste space . . . every cubic inch is a filing inch.

The "Lab-aid" laboratory filing system comprises a range of versatile equipment which brings new standards of filing efficiency to the pathological laboratory. For a descriptive bulletin, please use the coupon below.

The TECHNICON Company
215 E. 149th St., New York 51, N. Y.

Testing for sound lost between telephone receiver and ear. Many subjects were used in these tests.

How to compensate for a curl . . . and add to your telephone value

Bell scientists know that the telephone is not used under ideal laboratory conditions. There is never a perfect seal between receiver and user's ear. A curl may get in the way, or the hand relax a trifle. And ears come in many shapes and sizes. So some sound escapes.

Now, sound costs money. To deliver more of it to your ear means bigger wires, more amplifiers. So Bell Laboratories engineers, intent on a thrifty telephone plant, must know how much sound reaches the ear, how much leaks away. They mounted a narrow “sampling tube” on an ordinary handset.

The tube extended through the receiver cap into the ear canal. As sounds of many frequencies were sent through the receiver, the tube picked up a portion, and sent it through a condenser microphone to an amplifier. That sampling showed what the ear received.

As a result, Bell scientists can compensate in advance for sound losses—build receivers that give enough sound, yet with no waste. That makes telephone listening always easy and pleasant.

It's another example of the way Bell Telephone Laboratories work to keep your telephone service one of today's biggest bargains.

Bell Telephone Laboratories

-EEI-u

Working continually to keep your telephone service big in value and low in cost.
Three NEW Biological Texts and References... excellent in all respects

BOTANY
by R. DARNLEY GIBBS,
McGILL UNIVERSITY

A NEW text featuring the phylogenetic approach to the subject—from the simplest to the most complex. Algae, fungi, lichens, bryophytes, vascular plants, and seed plants are presented in their logical order. Each subject is covered with clarity and continuity. The text is unusually well balanced in the amount of material presented and in the emphasis placed on each subject.

Designed for a full year's course in college botany, it includes many photographs and drawings by the author from living material actually studied. Dr. Gibbs has thoroughly integrated text and illustrations into a comprehensive book easy to use in any locale.

Effective teaching aids include floral diagrams of the important flowering plants, an excellent and brief account of the development of plant physiology (especially the history of photosynthesis), and an outstanding description of plant pigments—their origins, composition and functions.

The modern accepted classification of plants is followed throughout and an extensive and complete index is included for easy reference.

261 Illustrations—118 Plates—554 Pages—$6.00

MORPHOLOGY and TAXONOMY of FUNGI
by ERNST A. BESSEY,
DEAN EMERITUS OF THE SCHOOL OF GRADUATE STUDIES, MICHIGAN STATE COLLEGE

A complete and orderly treatment of the structures, life histories and classifications of all the important groups of fungi. Both a text and reference, it is written by the foremost mycologist in the country today.

The new and specially prepared drawings are invaluable aids in the study of the subject. Each chapter is concluded with a list of keys to the orders, families and genera of the particular group discussed. This feature alone makes the book an indispensable aid in teaching and research. Of great importance is the 96-page guide to the literature for the identification of fungi, and the references at the end of each chapter.

210 Illustrations—791 Pages—$7.00

GENES, PLANTS and PEOPLE
by C. D. DARLINGTON and K. MATHER,
JOHN INNES HORTICULTURAL INSTITUTION, LONDON

An interesting collection of essays on genetics that have been written by two authors over a period of twenty years when both were working to solve the same problems from different points of view. The articles were written individually but have a unity of purpose.

The essays deal with plants and animals, medicine and agriculture, and offer new interpretations of evolution, development and disease. Several articles discuss the controversy between the genetic theory based on the traditional scientific method and that propounded by the latest Soviet school represented by T. D. Lysenko.

13 Figures—187 Pages—$4.00

A basic necessity for every nuclear laboratory is a beta-gamma monitoring instrument for checking bench and desk tops and determining safe approach distances. The Nuclear Model 2610A portable provides your laboratory with dependable protection against the harmful effects of radioactive isotopes and X-rays. You can make easy routine checks of every inch of your lab because the 2610A is arranged for fingertip control. The removable probe snaps into the handle for convenience. The proven circuit in a waterproof case gives you the reliable monitoring you demand for complete laboratory safety.

The 2610A is another of the many developments with which Nuclear engineers continually meet the ever-increasing demands of nuclear science.

Willis’
THE PRINCIPLES OF PATHOLOGY

A great need in the literature on pathology is met with this new book, for it embraces the WHOLE of pathology—expounded from its general principles. This approach greatly facilitates the use of the book either clinically or for research, for descriptions of lesions in the various organs are included in the accounts of the general processes and principles which they exemplify.

Willis has also incorporated all essential details regarding regional peculiarities of particular diseases and has made the information easily accessible by means of plentiful cross references and a full index. Conforming to the plan of the text, most of the 300 photographs and diagrams illustrate general principles rather than diseases of particular organs.

The book is beautifully literate—and of course purely scientific. It includes notes on the meaning of names, the history of pathology and the art of observation that will be of the utmost value to the reader. Willis writes with the skill of a great teacher—that is, one who imparts knowledge such as to make it a pleasure as well a duty to absorb.

Nicholson’s
STUDIES ON TUMOUR FORMATION

Doctor Nicholson was among the greatest histopathologists the world has known. His studies in pathological anatomy were renowned for their versatility as well as for the amount of information they contained.

The source of his material in STUDIES ON TUMOUR FORMATION was the surgical wards of Guy’s Hospital, London, where he was Clinical Microscopist. His twenty “Tumour Studies” which appeared in Guy’s Hospital Reports were considered classics. Just as Nicholson was persuaded to prepare his material in book form, he died.

In this volume, therefore, his “Tumour Studies” are reprinted in the original form—with no attempt to change or modify them. All of Nicholson’s drawings appear and no care or expense has been spared in reproducing these illustrations.

Anyone reading these Studies for the first time can be assured that along with an abundance of reliable factual information, he will find much that is arresting and entertaining—for Nicholson was a great philosopher and a gifted writer, as well as a studious biologist and pathological anatomist. The range of his subjects is astonishing, and his observations make one of the finest books it has been our pleasure to present to the profession.

By the late G. W. DeP. NICHOLSON, M.A., M.B., B.Ch., Professor of Pathology, Guy’s Hospital, London. 637 pages, illustrated. Price, $15.00.

ORDER FORM
Catalogus Lichenum Universalis

By ALEXANDER ZAHLBRUCKNER

Alexander Zahlbruckner’s major work, Catalogus lichenum universalis, consists of some 7,900 pages of references to families, genera, and species of the class Lichenes. This work, published in ten volumes with one index volume, was begun in 1922 and completed in 1940. It includes all references up to 1940 on lichens and their synonymy, thus making it a concise and complete bibliographical guide. It also includes the varieties and forms of about 15,000 species.

All the references pertaining to lichenological publications now scattered through the literature are brought together here. Students of lichenology and closely related fields, especially those in charge of curating private or public herbaria, will find this set a “must” in order to enable them to cite literature, trace synonyms, ascertain proper taxonomic relationships, and, in general, to answer a multitude of questions. Since the complete original work is very difficult to obtain, its reproduction will add immeasurably to our now inadequate basic reference material in lichenology.

9 Volumes and Index Volume, Berlin, 1922-1940, 7,360 pages

Hundreds of users in laboratory, field and factory now make
fluorescent checks quickly and easily—in broad daylight—with
the Menlo Fluoretor (blacklight).
Exclusive dark chamber holds comparison test tubes, solid
samples, powders or fluids. Neoprene viewing cone excludes
surrounding light for examination of large areas.
Choice of filtered 2537 or 3650-63 Angstrom frequencies;
interchangeable head for alternate frequency. Transmission
curve with every instrument. Standardized mercury-vapor
discharge tubes. Instant-starting, troublefree. Portable—weight
less than 2 pounds, ready to use. Models for operation from
either two standard flashlight batteries or 110-120 v AC.
Write for brochure, data on U-V use in your field.
