Cover
A female Lampsilis ovata ventricosa (Barnes). This fresh-water mussel is one of a
family having glochidia or young that are parasitic on the gills of fishes. The females
of this group, during the breeding season, develop lures, such as the fish-like projec-
tions of the edge of the mantle shown here. These projections attract fish to the
vicinity of the mussel, thereby assuring transfer of the young larva to the host. [J. H.
Welsh, Biological Laboratories, Harvard University]
