American Association for the Advancement of Science was founded in 1848 and incorporated in
its objects are to further the work of scientists, to facilitate cooperation among them, to
the effectiveness of science in the promotion of human welfare, and to increase public under-
and appreciation of the importance and promise of the method's of science in human progress.

COVER

Agaricia undata, the dominant reef coral of the fore-reef slope environment in Jamaica, West Indies. This
photograph, taken at a depth of 50 meters, shows only the central whorl, which is about 20 centimeters across.
The colony as a whole was about 3 meters across. This species, though extremely abundant, prefers very steep,
rugged marine slopes below the reef. It is rarely exhibited in museum collections. See page 383. [Thomas Goreau]
