FOR BEGINNING CHEMISTRY CLASSES...

Mettler high-speed top-loaders end weighing tie-ups

Precision and speed of the Mettler P120 make it best for student use in basic chemistry. It can do the work of two modern single-pan analytical types.

SPEED - a single weighing takes only a few seconds. A filling line indicator eliminates interruptions in weighing out materials. Faster weighings give students more time for actual laboratory work.

SIMPPLICITY - just load the pan and read the result. Students learn to use it in just a few minutes.

ECONOMY - high output of work makes it more economical, on a cost per student basis, than a modern analytical balance.

RUGGEDNESS - stands up to continuous classroom use, delivering hundreds of thousands of weighings with unequalled speed and precision. No special weighing room needed.

PRECISION - provides readability direct to one milligram and precision better than ±0.5 mg, realistic for the needs of beginning chemistry.

Ask for a demonstration of the Mettler P120, or request the new bulletin describing the use of top-loading balances in teaching. Write Mettler Instrument Corporation, 20 Nassau St., Princeton, N. J.
Looking into Microtome Cryostats?

IEC has three viewpoints for you.

The CTD — World’s Standard Cryostat
If your needs are for routine sectioning, space saving and economy, the CTD is ideal at $1645.

This is the famous IEC Microtome-Cryostat that revolutionized frozen sectioning techniques. From tissue to slide in 3 minutes vs. hours for paraffin methods. Model CTD is compact, low priced, ideal for routine sectioning. It features: ±1° C temp. control; internal quick freezing; a Minot Custom Microtome.

This exceptional microtome is ideally designed for frozen sectioning. It has few moving parts. A precision screw drive gives it a high order of accuracy. A ball and socket holder quickly orients the specimen to the knife. A simplified anti-roll device assures a uniform, continuous ribbon of tissue. Tough tissue won’t pull or snag. It uses any standard knife and cuts routinely from 2-16 microns. This microtome is 100% rustproof. You can put it in a sink and clean it with scalding water. And it does double duty too — in addition to frozen sectioning the Minot Custom Microtome handles paraffin work with equal ease.

The CTI — A Compact Research Cryostat
If your needs call for routine sectioning plus research work, the model CTI is a superior and economical choice at $1990.00.

This new, compact, advanced microtome cryostat is ideally suited for both research work and routine frozen sectioning. It features: ±1° C Temp. control; an internal quick-freeze block; a vacuum port for freeze drying. Quick defrost. Tissue to slide takes less than 3 minutes. Numerous other features and accessories. Of course the famous* Minot Custom Microtome is standard equipment.

The CTR — A Complete Sectioning Workshop
The model CTR is the world’s finest frozen sectioning workshop. Price: $2490.00.

In this advanced research model microtome cryostat, everything necessary for preparation, cutting, staining and examination of frozen sections can be done from one seated position, making the CTR the ultimate refinement in cryostat microtomy. Cold control to ±1° C. Tissue to slide in three minutes or less. Vacuum port for freeze drying techniques. Equipped, of course, with the superb Minot Custom Microtome.

Other facts to consider
Fact: The first open-top cryostat was made by IEC, the experienced company in the field. Fact: There are more IEC Microtome-Cryostats in use than any other, literally thousands. Fact: IEC-sponsored research made routine frozen sectioning practical and produced a definitive document on the technique.* Fact: The famous IEC Minot Microtome, standard on each model, is the only microscope ideally designed for frozen sectioning. Fact: Only IEC offers you a complete instrument family from which you can best fill your particular needs, workload and budget. Write for Bulletin CT for complete details.

From fast delivery “off the shelf”...
has not closed his eyes. Instead, we are given an irrelevant (in this context) record showing that the first twin's eye closure did not influence alpha in an unrelated subject.

Victor G. Laties
Bernard Weiss

References

The report of Duane and Behrendt . . . has so heated the mail to my usually quiet ivory tower that I now need insurance. One nonparascientist even asked: “Ought I not to resign from the AAAS?” Should the editors have accepted this paper? The pro answer is: Galileo. Science is hindered when the Establishment undertakes censureship. The contra answer is: Space is too precious nowadays to allow for the printing of raw data, and these data are raw, for they state merely an empirical relation, an empty correlation, that lies out of further relation to any understood body of scientific fact. Besides, there is a literature which these authors do not cite and seem not to know. It seems clear that Soal’s marvelous Welsh schoolboys connived by what now seems clearly to have been trickery to fool many important investigators [S. G. Soal and H. T. Bowden, The Mind Readers (London, Faber and Faber, 1959)]. Those boys were in separate rooms. How well shielded were the twins of Duane and Behrendt from each other? Did the recipient twin have his eyes continuously open or continuously closed? Could he have known when the sending twin was asked to close his eyes? Identical twins are accustomed to cooperate, and these twins were the only ones who knew the biology of what was going on. Anyhow, the major difficulty is that these twins (two out of 15 pairs) presented the experimenters with a correlation that they could not explain. So it has always been. The parascientist (as does his complement) pits his ingenuity against the inscrutability of nature, and when the parascientist fails he has succeeded, for he has discovered the inexplicable!

Evolution in Tennessee

In his letter headed “After Scopes” (22 Oct., p. 435), Thomas A. Cowan remarks, “Apparently no one else in the State of Tennessee has cared since the trial to challenge the constitutionality of the [anti-evolution statute].” No one, to my knowledge, has brought the matter to the state Supreme Court, but there has been concern about the issue. Around 1960, Arlo I. Smith led a group of professors, business leaders, and clergymen in appealing to the Tennessee legislature to remove this unfortunate law from the statute books. The legislative committee concerned refused to act, and consequently the matter was never brought to the floor of the legislature. Yet those of us who are native Tennesseans may still hope that the Renaissance will some day reach Tennessee.

Kenneth R. Barker
Department of Zoology, University of Texas, Austin 78712

Cowan’s letter implies that the theory of evolution is not being taught in state-supported schools in Tennessee. This is not true. At the University of Tennessee this subject is included in general zoology and botany courses, and courses on evolution and speciation are being taught at the upper-division and graduate level; this has been true for many years. I have made no survey to determine the extent to which evolution is taught within the state, but I know that the subject is included in courses in other state-supported universities and colleges and many of the textbooks used in high school biology courses.

One reason the statute has not been repealed is that it has so commonly been disregarded.

Help Sought with History

I am writing a history of the Huxley family, which is to be published in the United States and Britain next year, and would be grateful to hear from anyone who has recollections or reminiscences of interest.

Ronald W. Clark
10 Campden Street, Kensington, London, W.8
This instrument maintains a usable resolution of 0.001 absorbance unit over its entire measurement span of 0.000 to 2.000 A units. Its long term stability is better than 0.005 A per hour, requiring only occasional zero setting on a reference. And it combines this uncommon performance with explicitly simple operation.

The automatic time-impulse sampling system draws in less than 0.5 ml per sample with no handling of cuvettes or pouring of fluids. Touch a bar, and in a few seconds you flush out the previous sample, then introduce the next. The absorbance value appears immediately on the four-digit numerical indicator. Or, after a single calibration setting, you get direct readings of concentration in any convenient units.

Technicians find the compact Model 300 especially easy to use and maintain. Yet, here is a true spectrophotometer with research accuracy and flexibility, filling a realistic need in busy laboratories.

The remarkable sensitivity and stability of the Model 300 is a product of a unique electronic circuit, sophisticated optical and mechanical design and close tolerance manufacturing.

For special applications there are accessories for continuous flow arrangements, use of standard cuvettes and chart recording of absorbance data.

As vital diagnostic and research techniques improve, measurements often require new orders of sensitivity, precision and speed. The Gilford Model 300 is clearly ahead of this trend.
