COVER
One behavior pattern observed in young chimpanzees is clinging. It characteristically includes grasping and ventral contact with a social stimulus. The occasional posture of young chimpanzees, sitting with the arms folded across the chest while the hands grasp a contralateral limb, may be a self-directed form (huddling) of this pattern. See review of Behavior of Nonhuman Primates, vol. 2, page 1440. [Willa Martin, Covington, Louisiana]
