The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

COVER

Many details of plant mitosis in living cells have been made visible for the first time by differential interference microscopy. For example, spindle fibers appear as bundles of refractile elements extending from the kinetochores to the spindle poles (about X 5000). See page 572. [Andrew Bajer and Robert D. Allen, University of Oregon and Princeton University]
