Books for every student of chemistry—beginner or advanced

A New Book!

Masterton & Slowinski—
Chemical Principles

By William L. Masterton, Ph.D., University of Connecticut; and Emil Slowinski, Jr., Macalaster College.

Here is a major new text for the full-year introductory course in general chemistry, requiring only a high-school background in chemistry and mathematics. The authors depart from the traditional approach, especially in the handling of descriptive chemistry. Descriptive and historical foundations are integrated with presentation of theory and mechanisms (oxidation-reduction, acid-base, precipitation, complex ion formation, etc.), allowing a mathematical and applied integration of experiment with theory. Modern aspects of general chemistry receiving more than customary attention include: Metallic bonding, Chromatography, Mass spectrometry, Electrolyte solution theory, Free energy and entropy changes in reactions.

Heavy emphasis is placed on experimental proof of principles and concepts, on quantitative calculations that promote a logical approach to problem solving and laboratory practice on the part of the student, and on the particle structure of matter. The student is encouraged to predict and correlate the physical properties and chemical properties of pure substances and solutions.

New (3rd) Edition

Noller—
Textbook of Organic Chemistry

By Carl R. Noller, Stanford University.

This New (3rd) Edition is designed to fit the needs of the 90-100 hour basic course in organic chemistry . . . for both chemistry and non-chemistry majors.

The author gives equal weight to coverage of the theoretical, experimental, and practical aspects of organic chemistry. Systematically organized, this textbook introduces the student to the subject gradually, basing each step on what has gone before. Following an introduction to the scope of organic chemistry, two completely new chapters on chemical bonding and chemical reactivity provide a bridge from the usual course in general chemistry to the study of organic chemistry.

Extensive revision throughout this volume reflects recent advances in scientific knowledge. Several major sections have been entirely rewritten in line with current shifts in emphasis toward physical aspects of organic chemistry.

Many new problems have been added in this new edition, and earlier ones have been brought up to date. For the first time, answers to the problems are included in the book.

New (9th) Edition

Harrow & Mazur—
Biochemistry

By Benjamin Harrow, Ph.D., Emeritus, and Abraham Mazur, Ph.D., both City College, City University of New York.

Extensively revised, this long-respected text gives the student a sound, timely introduction to principles of biochemistry . . . and their application. The logical organization of the material fosters student understanding. The initial thirteen chapters present a solid core of biochemistry: the chemical structure and reactivity of biologically important compounds, and their manner of biosynthesis and degradation. The second half of the volume surveys the major areas of application of modern biochemistry.

The authors have shifted emphasis in this New (9th) Edition to match current concepts in theory and in teaching biochemistry. Cellular structure and function are more strongly stressed, and the role of genetics and physics in the chemistry of body function has been integrated into fundamental concepts. While established mechanisms are carefully considered, physical chemistry is not pursued in depth.

You may ask why buy a superspeed centrifuge when perhaps many of your projects require only low speeds, say, about 3,500 RPM. Reserve power is one answer! Whereas the ordinary centrifuge feels the strain early when asked to perform continuously at 3,500 or 5,000 RPM, the SORVALL SS-3 and SS-4 are merely "loafing along" at such speeds. Think what this means in terms of instrument life. Reserve power is also a mighty handy thing for that special job where extra high G's are called for. With SORVALL, they're there when you need them. And, of course, with the SS-3 and SS-4 you get the added advantages of rotor versatility, Gyro-Action Self Centering Direct Drive*, reliable controls (automatic on the SS-3), and unique safety rotor-chamber guard and cover*. Why settle for just an ordinary centrifuge when the same amount of dollars will buy you a long-term investment? Interested? For further information ask us for illustrated literature number SC-3SS.

The PAR Model CR-4 Low-Noise High-Gain Amplifier is designed for extremely small signal pre-amplifier applications and for use with PAR Lock-In Amplifiers to extend their low-level signal recovery capabilities. The unit features:

- differential or single-ended input
- selectable high (50M) or low (50K) input impedance
- 20 to 80 DB gain
- selectable bandpass 1 CPS to 300 KC
- long-life Hg or rechargeable NiCd battery pack
- completely transistorized
- easily panel mounted

- rugged printed circuit construction
- 6½” wide, 5” high, 8¾” deep
- price without batteries $575.00
- also available: several optional features such as impedance matching input transformer and fast-recovery Model CR-4A with selectable bandpass from 10 CPS to 300 KC

NOISE FIGURE CONTOURS
Experiments in general are performed at some definite source impedance level and over some definite frequency bandwidth. Noise referred to shorted input as frequently specified does not provide meaningful information for actual experimental applications. It is instead essential to know the noise characteristics of an amplifier not only at the particular operating frequencies but also with the particular source impedances actually encountered. Noise figure contours are the loci of points of constant noise figure (F) plotted as a function of source impedance and operating frequency, and, therefore, provide this complete information. They indicate the degradation in signal-to-noise ratio obtained with the pre-amplifier at a particular frequency with a particular source impedance, input noise being the Johnson noise generated by that source impedance at 290 degrees Kelvin. The contours are obtained from the following equation:

\[ F = 20 \log_{10} \frac{1 + \text{measured amplifier noise (including Johnson noise)}}{\text{calculated Johnson noise}} \]

Seconds from now

he’ll have his macrophotograph

photomicrograph
copyprint
or you name it

All from one camera. The Polaroid MP-3 Land camera.
In 10 seconds it gives you black and white macrophotographs, photomicrographs,
line copy slides, copies of any artwork, originals of almost anything (even wall charts).
In 20 seconds you can get finished 4 x 5 prints along with a true film negative.
In 60 seconds you can get prints in full color.
In 2 minutes you can get continuous tone slides.

What makes the MP-3 this versatile? Two reasons. First, it will use 14 different
Polaroid Land films. There’s one for every purpose. (It can also use conventional films.)
Second, there’s the adaptability of the MP-3 itself. There are five interchangeable lens
and shutter combinations, and an assortment of camera backs for Polaroid Land and
conventional films.

Can the MP-3 take care of your photographic requirements? Certainly.

ing to similar but individual action. Rather, united action tends to degrade scientists in the minds of those to whom we have entrusted our political and military activity and does harm to the cause and to science. I strongly believe that all persons, individually or collectively, should make such protests if they so desire, but they should not do so in ways that imply that they are beings having superior views because of their training or background. I am sure that our country is as safe in the hands of our duly elected and appointed representatives as it would be in the hands of scientists, engineers, physicians, or persons of any special discipline. If any scientist wants to participate in the administration of this country, let him get himself elected or appointed to an appropriate government office.

As a member of AAAS I was not pleased to read the resolution on Vietnam of the AAAS Council (7 Jan., p. 55). I believe the Council has misused the prestige of scientists to promote a point of view on a matter unrelated to the interests, responsibilities, and competence of scientists as a special group. Bakers, plumbers, ballet dancers, dentists, and scientists, as citizens, are all entitled to an opinion on the conduct of the war in Vietnam, but despite the Council's embarrassing effort to make it seem otherwise I fail to see why there is a scientist's position any more than a dentist's position or a plumber's position. . . .

Preservation of Privacy in Testing

In line with Wolfe's editorial, "Psychological testing and the invasion of privacy" (31 Dec. 1965), I would like to suggest that a solution to the dilemma might be possible through "on-line testing" by a computer. Two approaches are possible now.

1) The test questions could be stored in a computer and presented to the subject privately, one question at a time, via a typewriter printer or a visual display. The subject would key in his response and be presented with the next question. After the subject has answered all questions, the computer would be programmed to score the tests, present the results in proper form, and erase the subject's responses to the individual questions from its storage unit.

2) Another approach would be to use an answer sheet for the subject's responses. The subject himself would insert the sheet into an optical scanner for direct input to a computer or scoring machine programmed to score the test. The summary scores (not the individual responses) would then be supplied in the appropriate format for interpretation, and the subject would destroy his answer sheet.

In both of these approaches the responses of the subject would be known only to the subject. This, I believe, would minimize one of the main objections to psychological tests and would probably lead to more accurate responses by the subject.

Metric System: Congressional Study

Joseph Mayer ("Where does the metric system prevail?"—Letters, 22 Oct.), disputing a claim that 90 percent of the world's population operates under the metric system, tallies the dominant systems country by country. But it is beside the point to estimate the prevalence of the metric system in terms of geography. On the one hand, metric countries must use English measures in order to do business with us. On the other hand, even in the U.S. certain industries use metric measures as much as they can, and the metric system is used by all scientists, by the medical profession, and by many agencies of government. The metric system is used worldwide. It prevails wherever the need for scientific communication prevails. As shown by England's recent commitment to metric, it has finally won out in the area of economic interdependence. India, contrary to what Mayer implies, has almost completed her conversion and will benefit greatly as an infant industrial nation by going to the recognized international system; the change will enable India to eliminate her many regional weights and measures and with them the English system.
Does this presage a metric world? This is one of the questions that Senate bill S. 774 is intended to answer. Senator Pell's committee has stated the case simply and well: "The committee is convinced that it is timely and desirable to undertake a comprehensive study of the advantages and disadvantages of increased use of the metric system in the U.S., so that any future decision in this area can be based on a full knowledge of the facts." George Miller, Chairman of the House Committee on Science and Astronautics, first suggested this rational approach to the problem three Congresses ago. Recent hearings on both House and Senate bills brought forth overwhelming support for a study and very little opposition. Even opponents of metric conversion could be well served by a fact-finding study.

...Now before Congress is a series of bills to study "the practicability of the adoption by the U.S. of the metric system of weights and measures." Although such can hardly be construed as "compulsion," the move toward consideration was almost certain to elicit a response such as Mayer's. In 1926, Mayer was a prominent member of a group which persuaded Congress to defeat the Britten-Ladd bill, a bill to adopt the metric system for certain uses. It has taken Congress 40 years to take another close look at the issue, this time on a much more conservative basis.

It is, of course, too much to expect that people will welcome any change from their customary thought patterns. The need for Americans to convert to metric measures must first be recognized and fully appreciated. This all takes time and must be debated over and over again. ... Much would be accomplished by a thoroughly objective study and public airing of the issue. A national committee selected by the Department of Commerce should work with counterpart committees from other English-speaking countries. Obviously we can benefit from the prior experience of other countries of the world, 80 of which have adopted the metric system in the last 160 years. ...

An important new research and clinical tool for Electroanesthesia

Electroanesthesia (E.A.) is increasingly being used on large and small animals as a research and clinical tool. This form of anesthesia offers a drug-free-system that is readily reversible without requiring an antidote. Anesthesia is maintained as long as the electrical current is flowing; recovery is immediate and uneventful.

To assist the medical researcher in realizing the potential of E.A., Hewlett-Packard has focused its experience in electronic instrumentation on the development and production of the Model 3380B. This new instrument has been designed specifically to incorporate the latest characteristics requested by research groups investigating Electroanesthesia.

Write for our list of documentary films, a bibliography listing over 150 published reports on E.A., and a brochure on hp Model 3380B Electroanesthesia instrument. Price, f.o.b. factory, $795. 2/10 second recorder response over 10" span?

Easy with Esterline Angus Speed Servo®

**SPEED SERVO® FEATURES:**

**Response**
2/10 second over full 10" span.

**Speed Line Writing**
Breaks state-of-the-art barrier with exclusive inertial ink pump. Writes legible record at any speed, even at speeds above 100 inches per second.

**Input Impedance**
500,000 ohms off-balance.

**Accuracy**
± 0.4% of span for any range.

**Source Impedance**
Meets all specifications to 50,000 ohms, maintains rated accuracy to 100,000 ohms.

**Feedback Potentiometer**
Effectively infinite resolution conductive plastic feedback potentiometer. Lasts thousands of hours longer than any wirewound potentiometer.

**Adjustable Zero Adjustable Span (AZAS)**
Zero elevation or suppression continuously adjustable from 0 to 100 MV for any span setting. Span continuously adjustable from 1 to 100 MV.

**Solid State Amplifier**
Has all silicon transistors. Has high input impedance because field-effect transistor is used.

**Widest Chart Drive Selection**
Choose from 15, 10 or 5 speed automatic drives. Dial speeds from 1/2" per hour to 8" per second.

Here's the new way to make analytical weighings

TORBAL'S ALL-NEW EA-1 analytical balance gives a new look to precision weighing with direct digital readout to four decimal places. It does away with hairline "guestimation" over a full 160-gm capacity to a precision of ±0.03 mg. No micrometers or verniers are needed.

SOLID STATE electronic null indication gives needle motion seven times as large as optical image movement in conventional balances which means greater precision in weighing than ever before.

THE UNIQUE TORSION PRINCIPLE, used in all Torbal balances, gives the EA-1 friction free performance by using no knife edges or friction pivots. Only a slight flexing of a matched, tuned, set of special alloy torsion bands occurs when the EA-1 is used. There is no wear, no loss of accuracy and no friction to mar precision. Torbal balances retain their initial high sensitivity and accuracy for 20 years and more.

CHECK THESE OTHER FEATURES:
- No beam arrestment required
- Less effect from vibration
- Easy pan access from either side
- Large weighing chamber
- Substitution weighing principle
