MEETINGS

COVER

Surface made of dust and resembling the portion of the lunar surface photographed by Luna 9. The area shown is about 2 feet by 3 feet (0.6 meter by 0.9 meter). The material is dry, commercial Portland cement powder. The surface features were formed by throwing handfuls of powder at the surface in order to simulate the action of low-velocity ejecta from meteorite impacts in lunar soil. See page 290. [Cornell University]
