## COVER

One of the pair of al-Hadida (Wabar) craters, located in the Rub'al-Khali desert of southeastern Arabia. Meteorite material and coesite have been recovered from these craters, which are 55 and 97 meters in diameter. Scattered within the craters, around the lips, and beyond are lumps of white sandstone-like material. It is assumed that the lumps were produced by shock-lithification during meteorite impact (see page 382). [Arabian American Oil Company]

American Association for the Advancement of Science was founded in 1848 and incorporated in 1944. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.
