One of the pair of al-Hadida (Wabar) craters, located in the Rub’ al-Khali desert of southeastern Arabia. Meteorite material and coesite have been recovered from these craters, which are 55 and 97 meters in diameter. Scattered within the craters, around the lips, and beyond are lumps of white sandstone-like material. It is assumed that the lumps were produced by shock-lithification during meteorite impact (see page 382). [Arabian American Oil Company]
