Calender of Events

COVER
Rosette pattern created by red cells coated with antibodies and adhering to a human mononuclear cell. Receptors on monocytes, macrophages, and certain lymphocytes specifically bind a particular portion (the Fc-fragment) of immunoglobulin G molecules attached to the surface of red cells. The entrapped red cells are spheroidal and deformed but do not necessarily undergo phagocytosis (about X 9300). See page 1582. [A. F. LoBuglio, R. S. Cotran, and J. H. Jandl, Harvard Medical School]
