The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

Cover

Embryonic chick heart cells (trypsin disaggregated) were growth oriented in tissue culture for 8 days and formed a "heart"-shaped, synthetic strand of cardiac muscle. The preparation was fixed in Bouin's fluid and stained with phosphotungstic acid-hematoxylin (about x 6.8). See page 909. [Thurman Ellis, Duke University Medical Center, Durham, North Carolina]
