Larval aggregation of the sawfly Neodiprion rugifrons on its host, Pinus banksiana. The mature larvae
are displaying one of the alarm reactions that reduce attacks by para-
sites and predators; a raising of the anterior and posterior segments from
the needle surface, at the same time exuding orally a drop of gummy
fluid. Mature larvae are about 20 millimeters long. See page 1090. [G. Knerer, University of Toronto]
