FOR ANY TYPE OF GRADIENT — that is all you have to do when you program the LKB ULTRO-GRAD® gradient mixer. A pair of scissors is all you need to cut the gradient profile for exactly the type of gradient you require. Our technician has just cut three, and he now indicates that he will use the one in the scanning window. When he has set the scanning rate and the duration of the run, he will switch on and the ULTROGRAD will take over—automatically producing the gradient. He can program any type of gradient you like to name, from as many as three liquids at once.

With an optional level sensor, you can also monitor absorbance levels in an eluate and automatically vary the gradient, to provide greater separation of eluted components.

The second volume of this informative series of half-hour conversations between scientists and science journalists is now available. Scientists talk about their work with particular insight into a variety of topics of interest and concern. These twelve dialogues have been compiled by the AAAS and edited on six audiotape cassettes and packaged in an attractive album. The price of Speaking of Science Volume 2 is $34.95 to AAAS members and $39.95 to nonmembers (both plus postage and handling). To order your copy of this interesting and exciting volume complete the order blank.

1. The Dilemma of Prisons, Dr. John P. Conrad, Dr. Edith E. Flynn, Mr. J.D. "Sonny" Wells with William Hines
2. Science and Sociology of Weather Modification, Dr. J. Eugene Haas, Dr. Thomas F. Malone with Peter Calamai
3. New Dimensions in Human Genetics, Dr. Leon E. Rosenberg, Dr. Michael M. Kaback, with Barbara J. Culliton
4. Children and Environment: A New View, Dr. Jerome Kagan with Judy Randal and Edward Edelson
5. Energy Rationing, Dr. Earl Cook, Dr. Samuel Z. Klausner with William Hines
6. Forest Ecology and Management, Dr. Gene Likens, Dr. Arnold W. Bolle with Edward Edelson
7. Environment and Cancer, Dr. C.S. Muir, Dr. Marvin Schneiderman with Edward Edelson
8. Patterns of Discovery, Dr. Benjamin Bederson, Dr. John K. Hulm with Edward Edelson
9. The Limits of Growth: A Debate, Dr. Dennis Meadows, Dr. S. Fred Singer with David Perlman
10. Tragedy of the Commons Revisited, Dr. Garrett Hardin with Richard D. Lyons and Edward Edelson
11. Understanding Perception, Dr. Richard L. Gregory with Edward Edelson and Barbara J. Culliton
12. Exploring the Universe, Dr. Halton Arp, Dr. Herbert Friedman with Allen L. Hammond

Please send me ___ albums of Speaking of Science Volume 2 at $39.95 each, $34.95 for AAAS members (both plus $1.50 postage and handling).

**LETTERS**

**Energy Supply**

The problem of the present widening gap between available energy reserves and increased energy use is one of critical concern to all of us. As Philip Abelson points out (Editorial, 2 Mar., p. 857), "we cannot afford the luxury of sleeping for another 12 years."

There are two points raised in the editorial, however, that I would like to comment on, as they recur often in discussions of the petroleum industry. One is the idea of "windfall profits." Crude oil prices, over the last decade, remained remarkably more stable than prices in general and more stable than costs to the industry itself for equipment and personnel. During this period the price of crude oil rose 17.2 percent, from $2.90 a barrel to $3.40 a barrel. The U.S. Bureau of Labor Statistics wholesale price index rose 25.6 percent for all commodities over the same period. During these years, oil well casing prices rose 45.9 percent, oil field machinery prices went up 35.7 percent, and average hourly wages in oil and gas production climbed by over 57 percent. Over the past 10 years (1962–1971), the petroleum industry's rate of return on net worth has averaged 11.8 percent, compared to an average of 12.2 percent for all manufacturing industries, according to surveys reported annually in the April issue of the First National City Bank of New York's Monthly Economic Letter.

If taxes are excluded, the price of gasoline, the industry's most consumer-visible commodity, actually was lower in 1972 than it was 50 years earlier, when it averaged 24.8 cents per gallon. Permitting prices of petroleum products to reflect their true costs would certainly not lead to windfall profits.

I would like also to comment upon Abelson's allusion to the "tremendous resources, both financial and technological" of the industry. This, of course, is true, but size does not necessarily imply success. The tasks facing the industry are tremendous as well, if our energy needs are to be met over the next decade. The domestic capital needs of the industry are estimated at about $250 billion from 1971 through 1985—in 1970 dollars. According to one estimate, by 1985 we will need the equivalent of 160,000 productive oil and gas wells, some 400 to 500 large-capacity tankers, and the equivalent of more than 50 new refineries, for example, just to keep pace with rising consumer demands for petroleum.

To this end, the American Petroleum Institute has recently issued a statement of policy on energy, outlining the goals we believe are necessary to ensure continuing supplies of energy. Among the points we consider important are four that Abelson mentions: a return of coal to its former markets, a national storage plan for oil, immediate funding of research into nonconventional sources of fuel, and a national program to encourage more efficient use of energy. This statement is available free of charge.

**Jason and the National Defense**

The report on the defense consulting group Jason by Deborah Shapley (News and Comment, 2 Feb., p. 459) mentions the assertion by critics of the Kennedy Administration that those who aided the American war effort in Vietnam were guilty of "arrogance, amorality, or naivété." It is a fact, however, that this is a democracy and that actions by the U.S. government are on behalf of a majority of the American people. It is not consistent to condemn those scientists who aid our national defense without condemning the majority of the U.S. population. In fact, the question could be raised as to the morality of those scientists who would attempt to thwart the will of the majority because of their peculiar position in the society. Is it right for a scientist to weaken the national defense by refusing to contribute his part to it, so long as this is a democracy?

Shapley states that "Jason originated during Project 137, a 1958 conference involving economist Oskar Morganstern, and physicists Eugene P. Wigner and John Wheeler, who invited younger physicists along to familiarize themselves with military technical problems." Eugene Wigner had nothing to do with originating Jason. He has many times contributed his efforts to the national defense, but he has taken almost no part in the activities of Jason.

There are two compelling reasons why university scientists should act as consultants on national defense for the
U.S. government. (i) Such consulting introduces the thinking of university people into government planning. (ii) Without the contribution of American scientists to the development of new weapons, the United States would fall far behind predatory nations who would like to expand their borders and impose their will on others.

The News and Comment report pictures members of Jason as being continually apologetic for their contributions to national defense. I hope they are not, because their efforts are essential if the United States is to remain a government of free people.

Arthur A. Broyles
Department of Physics and Astronomy, University of Florida, Gainesville 32601

The Jason group itself did not originate during Project 137. But some young physicists who participated in the project formalized their relations with the Department of Defense, as the Jason group, the following year.—D.S.

We applaud the attention that Science has given to the Jason Division of IDA (Institute for Defense Analysis). Having recently published our own extensive study on the subject (1), we would like to comment on the issues that are reported.

We do not believe that Jason scientists are any more immoral, amoral, arrogant, or naive than many other scientists in this country. They are distinguished only by having been given the opportunity to participate at the very highest levels of national policymaking; and their now-publicized contributions to the war in Vietnam have brought them into the spotlight. While Jason members’ possible complicity in war crimes is a serious legal question, our major interest lies in seeing the broadest political implications in the whole Jason story.

One cannot view the Jason participants as simply neutral technical advisors. They work within a highly politicized context, defined by the objectives of the Department of Defense (DOD) and, more broadly, by the foreign policy of the Cold War. The Jason members, in accepting the secret and subservient nature of their advisory relationship to the DOD, have isolated themselves from any alternative political potential. Given this state of affairs, it would be foolish for Jason members to think that they as individuals could exert a politically liberalizing influence through their inside connections. (“You don’t confront generals,” was how one Jason member described their relations with the Pentagon brass during a briefing on Vietnam.)

Thus, the only option for Jasons who personally opposed the war in Indochina was to offer alternative technical solutions to the failing military campaign, solutions which were then utilized by the government, in fact, to prolong the war. This is the history of the automated battlefield, conceived by Jason in 1966.

Jason serves to oversee and correlate scientific research in many areas and to select for future exploitation those developments which might prove valuable to long-range military interests (2). Thus, when many concerned scientists bemoan the fact that so much of “pure” research ends up being applied to objectionable ends, we should understand that this is no accident, but a direct result of careful design. Furthermore, beyond its purely technical functions, Jason serves as an important ideological model for science in this country, since the prestige of such groups serves to legitimize the whole spectrum of scientists’ involvement with the military.

Our basic criticism of Jason is that it is intrinsically antidemocratic. It helps to put more power into the hands of a centralized and secretive military-political-economic apparatus which already has monopolized too much of the power in this country and throughout the world. It is not enough, at this time, for Jason members to express their personal regrets over their past contributions to the Vietnam war. The most constructive action they can take is to publicly resign from Jason, and from any similar organizations, and to make public the full scope of Jason-type activities.

References and Notes
2. The Report of the 1971 Jason Laser Summer Study (IDA Study S-391, Arlington, Va., 1971) is an example of this. Their figures show that 80 percent or more of the federal funds for laser development are in military areas, but we cannot learn more about this because volume 3 (“Unique military applications of lasers”) of the Jason report is classified.
the most widely used scientific information system in the world

Try any edition free for 4 weeks.

Nearly 200,000 professionals of all types use the Current Contents® system every week to locate and obtain new journal articles relevant to their work. And they've got good reasons.

Current Contents® is the most comprehensive, least complicated way to make sure you learn of new developments in your field while they're still new. Just an hour a week spent scanning any edition of Current Contents® lets you sort through everything that's published in a thousand or more journals. With CC® it's easy to pick out just those articles you want to read. Without handling the journals. Without increasing your journal subscription expenses.

Find out why so many people like you use Current Contents®. Get more information and a free 4-week subscription by completing the coupon.

Please start my free 4-week subscription to the Current Contents® edition checked below:
