CONTENTS:

Present Problems of Geophysics: Dr. George F. Becker ........................................... 545

The Domain of Physiology and its Relations to Medicine: Dr. S. J. Meltzer .................... 557

Scientific Books:—

Nuttall's Blood Immunity and Blood Relationship: Dr. J. Ewing, Schumann's Praktikum für morphologische und systematische Botanik: B. L. R. .............................................. 562

Scientific Journals and Articles ......................... 565

Discussion and Correspondence:—

The Stomach Stones of the Plesiosaurs: Professor S. W. Williston ......................... 565

Special Articles:—

An Artificial Root for Inducing Capillary Movement of Soil Moisture: L. J. Briggs, A. G. McCall ..................................................... 566

Notes on Inorganic Chemistry:—

Iron Hydroxid as an Antidote for Arsenic; Phosphorescent Zinc Sulfid; Platinum Sulfate: A New Carbide of Molybdenum: J. L. H. ................................................................. 569

The American Association for the Advancement of Science:—

Minutes of the Committee on the Policy of the Association: Dr. L. O. Howard ............. 570

Scientific Notes and News ............................... 572

University and Educational News ................. 575

MSS. intended for publication and books, etc., intended for review should be sent to the Editor of SCIENCE, Garrison-on-Hudson, N. Y.

PRESENT PROBLEMS OF GEOPHYSICS.*

Advances in science are seldom made without a view to the solution of specific, concrete problems, even when the results of investigation possess the widest generality. The history of science is full of instances of the fruitfulness of researches the immediate purposes of which were narrowly defined. Geophysics is only that portion of general physics, including under that term physical chemistry, which is applicable to the elucidation of the past history and present condition of the earth. It is thus a very definite branch of applied science, the exigencies of which call for the solution of a group of related problems. These, however, possess great interest apart from their application to the globe, while for the most part they offer very serious experimental and theoretical difficulties. Had they been easy, they might have been solved long ago, for many of these problems have been propounded and more or less discussed from the birth of modern science to the present day. Their difficulty, not lack of recognition of their importance, has postponed their solution.

The main purpose of this paper is to deal with the order in which it would be expedient to investigate the questions embraced under the head of geophysics, but a brief and incomplete enumeration of the problems from a geological standpoint will serve to lend a coherency and a human

* Address delivered at the International Congress of Arts and Science, at St. Louis, before the Geophysical Section of Department 12, on September 21, 1904.
