COVER

Sections of pancreas from five mice (arranged vertically) stained with fluorescein-labeled antibody to reovirus and rhodamine-labeled antibody to insulin. When viewed with fluorescein filters, cells containing viral antigens appeared green (left column). When the same sections were viewed with rhodamine filters, insulin-containing β cells in the islets of Langerhans appeared orange (middle column). Double-exposure photography (right column) shows viral antigens in β cells. Transition from top to bottom reveals a progressive increase in the number of β cells infected with reovirus. See page 529. [T. Ono-
