COVER

The eruption of Krakatoa on 26 and 27 August 1883 was the most violent that
has been recorded. Two-thirds of an island disappeared, part of it being flung
into the stratosphere. A large number of tiny particles remained there for 3
years or more causing spectacular sunsets all over the world (see cover). A
special volume that detailed phenomena attending the eruption was prepared by
the Royal Society and published in 1888. See page 1336 for excerpts from a
review of the report which appeared in the 9 November 1888 issue of Science.
