COVER

Early spatial representation of the perceptual similarities between nine colors, obtained by a multidimensional scaling analysis of errors during paired-associate learning. The closeness of any two colors was determined by the frequency with which a response number ("one" through "nine") arbitrarily assigned to one color was mistakenly made to the other during learning. See page 390. [Roger N. Shepard, Department of Psychology, Stanford University, Stanford, California]
Science 210 (4468), 376-460.
