COVER

Juvenile Belding’s ground squirrels (Spermophilus beldingi) at Tioga Pass, California. These littersmates (about 1 month old) have been above ground 1 day. Adult females in this social rodent species mate polygamously. Electrophoretic paternity exclusion analyses indicate that most litters are sired by more than one male. Therefore, these squirrels may be either full siblings or maternal half-sibs. See page 351. [George D. Lepp, Los Osos, California]
