COVER

General view of the excavation in 1970 into the east-west profile left by D. A. E. Garrod in the Tabun Cave on Mount Carmel. This 10-meter section yielded evidence of about 75,000 years of human development early in the last interglacial-glacial cycle. Removal of material in alternate 1-meter squares allowed close control of the complex stratigraphy. See page 1369. [A. J. Jelinek, Department of Anthropology, University of Arizona, Tucson 85721]
