Nestling bald eagles (Haliaeetus leucocephalus), about 5 weeks old, in northwestern Ontario, Canada. The birds fledge when 10 to 12 weeks old and acquire the familiar white feathers on the head and tail at age 4. These birds have been banded (visible on leg in foreground) for individual identification. Reproduction of this species increased markedly following the ban of DDT. See page 1232. [James W. Grier, North Dakota State University, Fargo 58105]
