COVER

Schools of juvenile French and white grunts (Haemulidae: Haemulon flavolineatum and Haemulon plumieri) in a coral head (Acropora palmata) in St. Croix, U.S. Virgin Islands. Excretory products from these fish are a source of nutrients for the coral head in which they rest. The presence of resident grunt schools leads to a higher rate of coral growth. See page 1047. [G. S. Helfman, Zoology Department and Institute of Ecology, University of Georgia, Athens 30602]
