Prolonged Ca\(^{2+}\)-Dependent Afterhyperpolarizations in Hippocampal Neurons of Aged Rats: P. W. Landfield and T. A. Piter

Selective Deficits in the Sense of Smell Caused by Chemical Modification of the Olfactory Epithelium: J. R. Mason, L. Clark, T. H. Morton

Diagnostic Potential for Human Malignancies of Bacterially Produced HTLV-I Envelope Protein: K. P. Samuel et al.

Cloning of the Chromosome Breakpoint of Neoplastic B Cells with the t(14:18) Chromosome Translocation: Y. Tsujimoto et al.

COVER

Satellite ocean color image showing the distribution of phytoplankton pigments around the Galápagos Islands during El Niño. This computer-processed image, color-coded according to concentration range, was produced from data collected on 1 February 1983 using the Coastal Zone Color Scanner aboard NASA’s Nimbus-7 satellite. Regions of high concentrations (above 1 milligram per cubic meter) are orange; intermediate levels, yellow and green; lowest levels (less than 0.2 milligram per cubic meter), blue. Major islands are black and clouds white. North is at the top; equator lies horizontally just above the center of the image. See page 1069. [G. Feldman, State University of New York, Stony Brook 11794; D. Clark, National Oceanic and Atmospheric Administration, Washington, D.C. 20233; and D. Halpern, National Oceanic and Atmospheric Administration, Seattle, Washington 98115]
