COVER  Autoregulation of yeast copperthionein gene. Yeast cells were grown on a 
bromthymol blue galactose indicator plate on which positive cells are yellow 
and negative cells are white. Both strains contain an episomal fusion gene 
in which yeast copperthionein regulatory sequences drive the expression of 
bacterial galactokinase. The cells to the left contain multiple copies of the chromosomal structural gene for copperthionein and are galactose-negative. The cells to the right lack an intact copperthionein gene and are galactose-positive due to increased basal transcription of the fusion gene. See page 685. [Dean H. Hamer, National Institutes of Health, Bethesda, Maryland 20205]
