Articles

1125 Science and Technology Policies and Priorities: A Comparative Analysis:

L. L. Lederman

The Discovery of a Class of High-Temperature Superconductors: K. A. Muller

and J. G. Bednorz

Magnetic Field Reversals, Polar Wander, and Core-Mantle Coupling:

V. Courtillot and J. Besse

Picosecond Holographic-Grating Spectroscopy: D. A. Wiersma and K. Duppen

The Nerve Growth Factor 35 Years Later: R. Levi-Montalcini

Transcriptional Regulation in the Yeast Life Cycle: K. Nasmyth and D. Shore

Leukotrienes and Lipoxins: Structures, Biosynthesis and Biological Effects:

B. Samuelsson, S.-E. Dahlén, J. Å. Lindgren, C. A. Rouzer, C. N. Serhan

Transgenic Plants as Tools to Study the Molecular Organization of Plant Genes:

J. St. Schell

Migration and Western Europe: The Old World Turning New: G. Therborn

Science is published weekly on Friday, except the last week in December, and with an extra issue in February
by the American Association for the Advancement of Science, 1333 H Street, NW, Washington, DC 20005. Second-class postage (publication No. 484460) paid at Washington, DC, and at an additional entry. Now combined with The

Scientific Monthly® Copyright © 1987 by the American Association for the Advancement of Science. The title SCI-

ENCE is a registered trademark of the AAAS. Domestic individual membership and subscription (51 issues): $55. Do-
mestic institutional subscription (51 issues): $93. Foreign postage extra: Canada $32, other (surface mail) $27, air-surf-

face via Amsterdam $45. First class, airmail, school-year, and student rates on request. Single copies $2.50 ($3 by mail).
back issues $4 ($4.50 by mail); Biotechnology issue: $5.50 ($6 by mail); classroom rates on request; Guide to Biotech-

nology Products and Instruments $16 ($17 by mail); change of address: allow 6 weeks, giving old and new addresses

and seven-digit account number. Authorization to photocopy material for internal or personal use under circum-

stances not falling within the fair use provisions of the Copyright Act is granted by AAAS to libraries and other users registered
with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided that the base fee of $1 per copy
plus $0.10 per page is paid directly to CCC, 21 Congress Street, Salem, Massachusetts 01970. The identification code
for Science is 0036-8075/87 $1 + $0.10. Postmaster: Send Form 3579 to Science, 1333 H Street, NW, Washington, DC
20005. Science is indexed in the Reader's Guide to Periodical Literature and in several specialized indexes.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1878. Its objects
are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility,
to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appre-
ciation of the importance and promise of the methods of science in human progress.
Reports

1189 Biogenic Sulfur and the Acidity of Rainfall in Remote Areas of Canada: J. Õ. NLIGU, D. A. HOLDWAY, R. D. COKER

1192 Lateral Isotopic Discontinuity in the Lower Crust: An Example from Antarctica: R. I. KALAMARIDES, J. H. BERG, R. A. HANK

1195 Japanese Quail Can Learn Phonetic Categories: K. R. KLUENDER, R. L. DIEHL, P. R. KILLEEN

1197 Chemical Conversion of a DNA-Binding Protein into a Site-Specific Nuclease: C.-H. B. CHEN and D. S. SIGMAN

1201 Seismomagnetic Observation During the 8 July 1986 Magnitude 5.9 North Palm Springs Earthquake: M. J. S. JOHNSTON and R. J. MUeller

1204 Chemotaxattractant-Regulated Mobilization of a Novel Intracellular Compartment in Human Neutrophils: N. BORREGAARD, L. J. MILLER, T. A. SPRINGER

1208 Corresponding Spatial Gradients of TOP Molecules in the Developing Retina and Optic Tectum: D. TRISLER and F. COLLINS

1210 Tumor Necrosis Factor (Cachectin) as an Essential Mediator in Murine Cerebral Malaria: G. E. GRAU, L. F. FAJARDO, P.-F. PIQUET, B. ALLET, P.-H. LAMBERT, P. VASSALLI

1212 Neurosteroids: Cytochrome P-450sec in Rat Brain: C. LE GOASCOGNE, P. ROBEL, M. GOUEZOU, N. SANANES, E.-E. BAULIEU, M. WATERMAN

1215 An Upper Eocene Frog from the Dominican Republic and Its Implication for Caribbean Biogeography: G. O. POINAR, JR., and D. C. CANNATELLA

1217 Measuring the Human T Cell Receptor γ-Chain Locus: W. M. STRAUSS, T. QUERTERMOS, J. G. SEIDMAN

1219 Cocaine Receptors on Dopamine Transporters Are Related to Self-Administration of Cocaine: M. C. RITZ, R. J. LAMB, S. R. GOLDBERG, M. J. KUHAR

4 SEPTEMBER 1987
Scientiﬁc Europe

inﬁnite riches in a little room” is a phrase of Christopher Marlowe’s that aptly describes the past history and present accomplishments of the region that was the cradle of professional science as we know it today. Individual scientists in mathematics, chemistry, and physics existed in the early history of India, China, and the Middle East, but the great names of modern science began to emerge in the 17th and 18th centuries in Europe. It is of interest to speculate on the particular combination of factors that led to this ﬂowering. Europe in that era combined qualities of elitism and democracy, respect for authority and rebelliousness, philanthropy and industrial aggressiveness, on which science ﬂourishes. Science requires elitism, an elitism of ability and dedication rather than entrenched privilege, and it establishes a measure of accomplishment that is not based on the assumption that all are equal. However, science will ﬂourish only in a democratic environment in which unknown investigators in a veterinary college can challenge the leading chemists in the most illustrious institutions. Science is built on respect for previous scientists but is accelerated by rebellions that overthrow dogmas of the past. Scientists must be adventurers, but they are usually impertinent and need wealthy patrons, either private individuals or government treasuries.

The political ferment, nascent democracies, industrial revolution, and geographical explorations of Europe in that period undoubtedly provided an encouraging atmosphere for scientists. Gradually the gifted amateur was replaced by the paid professional, and larger laboratories and organized structures emerged. Today, science in Europe is ﬂourishing, even though impeding changes in funding pose some serious problems.

This issue of Science selects a few individuals out of hundreds who might have been chosen to represent the colorful spectrum of developments radiating from Europe. Müller and Bednorz describe the new class of superconductors that has turned solid-state physics into a turbulent ﬂuid of publication and excitement. Samuelsson and colleagues describe the expanding universe of arachidonic acid metabolites that have been shown to play a dramatic role in cellular responses associated with immunity and inﬂammation. Wiersma and Duppen demonstrate that picosecond spectroscopy is an advance of many orders of magnitude over Galileo’s use of his heartbeat for timing purposes. Schell moves plant genes ad libitum in another green revolution. Courtillot and Bess show that the earth’s mantle moves too, but at 5 centimeters per year and even hesitates occasionally for a few million years. Nasmyth and Shore use modern techniques to clarify the cell cycle of the most domesticated of our eukaryotes, yeast, and Levi-Montalcini describes the growth factor that shapes our brains even as we sleep.

Therborn describes the movement of labor and the treatment of immigrants, and the policies and funding of science in representative countries in Europe are compared to that of Japan and the United States by Lederman. The personal and political aspects of those policies, particularly their international relationships, are described by staff writers Dickson and Norman. These articles show that the diversity of cultures in Europe, which possibly was a major factor in the development of science in its early days, has posed problems for science as bigger projects and large-scale interactions are needed. The manner in which the pride of nations is handled, the individualism of scientists and limitations of budgets, may be important not only for science but for other types of international cooperation.

No series of books, nor even a particularly perceptive issue of Science, could possibly do justice to science in Europe. A sampling of its variety and productivity, its differing patterns of funding and support necessary only to purify a glorious past but highlights the productive present. Those who think that science is merely technology turned on by money can learn from the example of Europe, where a combination of adventurism and ingenuity guided by leaders ultimately worldwide scientific productivity. Europe had the combination of established and anarchic individualism that is essential for a discipline that depends on its past but should not be controlled by it. The scientiﬁc system that grew out of the European experience has led to increases in the standard of living that are more widespread and permanent than any terrestrial discovery. The entire world, as well as present Europeans, has beneﬁted from this great legacy.—DANIEL E. KOHLAND, JR.
