---

Dried intestinal contents of a hawkbill turtle (*Eretmochelys imbricata*). Glass-like needles are siliceous sponge spicules (ash content 92 percent of dry mass). The reef-dwelling hawkbill, endangered throughout its circumtropical range, feeds almost exclusively on orthocid and hadromerid sponges in the Caribbean. See page 393. [Anne Meylan, Bureau of Marine Research, State of Florida Department of Natural Resources, St. Petersburg, FL 33701]
