833 Painting the Phase Space Portrait of an Integrable Dynamical System: S. Coffey, A. Depret, E. Depret, L. Healy
Graphical representation of the motion of satellite orbits in phase space (the space whose dimensions are position and momentum). Each point fixes the orbital eccentricity and argument of periapse; color bands correspond to constant energy levels. Rendered by contour “painting” on a massively parallel processor, the plot reveals a startling configuration of equilibria spawned by pitchfork and saddle node bifurcations. See page 833. [Computer graphics generated on a Thinking Machines Corporation CM-2 by Etienne Deprit and Liam Healy, Naval Research Laboratory, Washington, DC; photographic image by Mark Stucky]
