Reports

152 A Thiosulphate Shunt in the Sulfur Cycle of Marine Sediments: B. Jørgensen
A transmission electron micrograph (magnification ×16,000) of a human neutrophil that is degrading particles of antibody-coated, insoluble elastin in the presence of human plasma. Although endogenous plasma proteinase inhibitors cannot regulate proteinase-mediated proteolysis at sites of tight cell-substrate contact, subjacent substrates can be protected from the attacking proteinases by secretion leukoprotease inhibitor, a structurally unique proteinase inhibitor normally concentrated in human mucous secretions. See page 178. [Photograph by Andreas R. Huber, Sandra Regiani, Bruce Donohoe, and Stephen J. Weiss]
