The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objectives are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, to advance education in science, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.
Electron micrograph of the Hin invertasome, a novel nucleoprotein structure that contains three distant DNA sequences brought together by the interaction of two different proteins. The Hin protein (a site-specific recombinase) binds to two recombination sites that are subsequently localized to the Fis-bound recombinational enhancer by Hin-Fis protein-protein interactions. This complex assembly represents a key intermediate in the recombination reaction. See page 511. [Karen A. Heichman and Reid C. Johnson]
