1125 Scaling Population Density to Body Size in Rocky Intertidal Communities: P. A. Marquet, S. A. Navarrete, J. C. Castilla
The rocky intertidal zone of central Chile during a spring low tide showing zonation pattern and dominant sessile invertebrates (Perumytilus purpuratus and chthalamoid barnacles) and algae (Lessonia nigrescens and lithothamniioids). In this zone, communities of invertebrates are heavily modified by human predation on ecologically critical organisms, affecting dominance, population densities, and the network of species interactions. In spite of the dramatic changes produced by human intervention, the relation between body size of invertebrates and their population density remained unchanged. See page 1125. [Photograph by A.
