Mouse embryo at 11.5 days of development. This embryo harbors a  $\beta$ -galactosidase transgene linked to the promoter of the *myogenin* gene, active in skeletal muscle formation. The expression pattern of the transgene (in blue) reflects that of the endogenous *myogenin*

locus and is restricted to the myotomal region of the somites and the limb buds. Mutations in the *myogenin* promoter suggest that separable regulatory elements govern *myogenin* expression in somites and limb buds. See page 215. [Photograph: Tse-Chang Cheng]
