Mantle mechanisms

This issue of Science is dedicated to the study of the mantle, with articles on mantle plumes, mantle mechanisms, and the potential presence of dinosaur blood cells. The issue also includes policy forum discussions on misconduct in science and research news articles on Dino DNA, electronic time-stamping, and the immune system's evolution.

Mouse embryo at 11.5 days of development. This embryo harbors a β-galactosidase transgene linked to the promoter of the myogenin gene, active in skeletal muscle formation. The expression pattern of the transgene (in blue) reflects that of the endogenous myogenin locus and is restricted to the myotomal region of the somites and the limb buds. Mutations in the myogenin promoter suggest that separable regulatory elements govern myogenin expression in somites and limb buds. See page 215. [Photograph: Tse-Chang Cheng]
