SCIENCE • VOL. 267 • 20 JANUARY 1995
The "hot spot" of binding energy in the complex between human growth hormone (dark gray) and the extracellular domain of its receptor (light gray). The amino acid residues that make contact across the interface are colored according to how much energy they contribute to the binding interaction (red, substantial contribution; light blue, minor or no contribution; dark blue, not tested). Small complementary subsets of contact residues on each protein provide most of the binding energy. See page 383. [Graphics: Tim Clackson, Kerrie Andow, and James A. Wells]

Correction
The title of the report by M. Traviso et al. was incorrect in the 6 January Table of Contents on page 7. It should have been "Experimental tests of the roles of adaptation, chance, and history in evolution." The report appeared on page 87.
