Head of a fruit fly, *Drosophila melanogaster*, viewed by scanning electron microscopy (approximate magnification, $\times 380$). Targeted expression of the *eyeless* gene induced the formation of eye facets on the antenna (to the lower right of the eye), which are very

similar to the facets of the normal eye, identifying *eyeless* as the master control gene of eye morphogenesis. See page 1788 and the News story on page 1766. [Photo: Andreas Hefti and Georg Halder]
