Model of the 93-base pair loop that forms to repress the transcription of the *Escherichia coli* lac operon structural genes. The lac repressor tetramer (violet ribbon) binds two operators (red), and the catabolite activator protein (purple ribbon) binds to a separate DNA site (blue). The lac promoter regions are highlighted in green. See page 1247 and the related Perspective on page 1245. [Image created with Biosym Insight II]
