THE FUTURE WHEAT SUPPLY OF THE
UNITED STATES

The subject of our future wheat supply is seen at once to involve four separate
questions, as follows: (1) What is the possible increase in production that may be
attained? (2) How may it be attained? (3) What is the probability of such attain-
ment? (4) Will this production satisfy the demand?

It is evident also that no tangible benefit can come to the reader of any discussion of
this subject which does not have application to some definite period of time. It is
assumed, therefore, in this present discussion that we are concerned with movements
in the next forty years—or a period closing with the year 1950.

POSSIBLE INCREASE IN WHEAT PRODUCTION

An increase in wheat production can arise in two ways: (1) By an increase in
the wheat acreage, and (2) by an increase in acre yields.

INCREASING THE WHEAT ACREAGE.

The wheat acreage may be increased through an expansion in the farm area and also by devoting a larger percentage of the present farm area to wheat.

Expansion of the Farm Area.—The total land area of the United States is 1,900,-
947,200 acres. By the census of 1900 it was shown that at that time 44.1 per cent.
of this area, or 838,591,774 acres, was included in farms. The farms were of all
sizes, and of course were not entirely cultivated, many of them in fact, being large
