COVER
Cranium of Australopithecus sediba (specimen UW88-50), a new species of australopith found at the Malapa site in South Africa. Two partial skeletons, dated to about 1.9 million years ago, share many derived features with Homo and may thus shed light on the evolution of that genus. See the related Research Articles on pages 195 and 205 and the related News story on page 154.
