False-colored atomic force micrograph of two types of molecules forming a mixed self-assembled monolayer on a gold surface. The two molecules differ in height by 0.2 nanometers, giving the appearance of ripples. This image was awarded first place in the photography category in the 2010 Science/NSF International Science & Engineering Visualization Challenge. The winning entries are featured in a special section starting on page 847 and at www.sciencemag.org/special/vis2010/.

881 The Crystal Structure of the Signal
Recognition Particle in Complex
with Its Receptor
S. F. Ataide et al.
Guanine triphosphate controls changes
in the signal recognition particle that
facilitate transfer of the signal sequence
to the translocon.
892 Quantum Reflection of He2 Several
Nanometers Above a Grating Surface
B. S. Zhao et al.
The helium molecule can interact at large
distances with the evanescent repulsion
potential of the surface.
894 Spin Selectivity in Electron Transmission
Through Self-Assembled Monolayers of
Double-Stranded DNA
B. Göhler et al.
Photoelectrons emitted from a DNA-covered
gold surface can have an unbalanced
spin population of up to 60%.
