Cell differentiation - FGF basic protein (Active)

Human embryonic stem cells were differentiated. BMP-4, FGF-basic (ab9596) and VEGF (ab9571) were added to direct differentiation. These images show that CD31 (in green) and CD34 (in red) are abundant and represent primitive haematopoietic cells. DAPI staining is in blue.

Bioactivity of human expressed IL-4 (ab83686)

Assays were conducted to compare the bioactivity of human expressed proteins and their non-human expressed counterparts such as E.coli expressed, or other mammalian expressed proteins.

Chimpanzees are complex, long-lived creatures who share 96 percent of our DNA. Yet while their emotional needs and capacity for suffering are much like our own, the immunological and physiological differences between us make them poor models for human disease research.

There are better alternatives. That’s why more than 700 researchers, scientists and health professionals have signed in support of efforts to end the use of chimps in harmful research and testing in the United States, and to provide permanent sanctuary to chimpanzees currently in laboratories.

Join them. Sign on at humanesociety.org/supportchimps.
Congratulations to our 2011 winners!

Dr. Erez Lieberman Aiden
Grand Prize Winner and Regional Winner, North America
Essay: Zoom!

Dr. Eran Eden
Regional Winner, All Other Countries
Essay: Proteome Dynamics and Fate of Individual Cancer Cells in Response to a Drug

Dr. Felipe Karam Teixeira
Regional Winner, Europe
Essay: Mechanisms of Transgenerational DNA Methylation Inheritance

Dr. Tatsuya Tsukahara
Regional Winner, Asia
Essay: CDK Directs the Chromosome Passenger Complex to Centromeres for Chromosome Bi-Orientation

The highest quality antibodies for the study of Epigenetics from Cell Signaling Technology

- Innovative products from Cell Signaling Technology offer unsurpassed sensitivity, specificity, reproducibility, and performance.
- Extensive in-house validation means optimization is not left up to you.
- Technical support provided by the same scientists who produce and validate the products translates into a thorough, fast, and accurate response.

TOP IMAGE: Heterochromatin is characterized by a repressive, tight packaging of nucleosomes, which impedes transcription factors from gaining access to regulatory sites on the DNA. Methylation of cytosine bases in regions called CpG islands, found in many gene promoters, leads to formation of transcriptionally repressed heterochromatin. Methylation of cytosine bases by DNA methyltransferases (DNMTs) facilitates recruitment of Methyl-CpG-binding Protein 2 (MeCP2), which brings along other associated proteins, including histone deacetylases (HDACs), histone methyltransferases (HMTs), and Heterochromatin Protein 1 (HP1). These proteins then facilitate the deacetylation and methylation of histone proteins, resulting in the formation and maintenance of the repressive state of heterochromatin. **Science Translational Medicine**

*Science Translational Medicine*, the newest weekly journal from AAAS, is focused on applications of basic research knowledge to improve human health.

The goal of *Science Translational Medicine* is simple: help the scientific community harness decades of progress in research at the basic level and translate these biological discoveries into medical advances.

*Science Translational Medicine* publishes:
- Peer-reviewed primary research papers
- Perspectives and reviews on research from basic science and clinical viewpoints
- Survey of recent literature and findings in other journals
- Commentary on policy, funding, regulatory issues, and more.

As a AAAS member, add *Science Translational Medicine* access for over 60% off of the regular price. Subscribe in any of these ways:
- Go to ScienceTranslationalMedicine.org
- Call +1 202-326-6417
- Mail or fax this form with your payment to +1 202-842-1065

**Subscribe now for 1 year's access to Science Translational Medicine**

**AAAS member price:**
- ☐ US$52 online only
- ☐ US$225 print and online (add US$100 for non-US delivery)

AAAS membership number required ______________________________

**Nonmember price:**
- ☐ US$156 online only
- ☐ US$465 print and online (add US$100 for non-US delivery)

As a leading supplier of immunological reagents, eBioscience delivers product quality and value across a variety of applications, color formats and areas of biological research. Our expertise in developing and maintaining standards of excellence assures our customers consistency and convenience throughout our product portfolio.

Full Spectrum Antibodies
Tested on relevant biological models, broad fluorophore formats for most cytometers, and convenient test size options

High Performance Immunoassays
Flexible for any workflow situation – multiplexed data, high sensitivity or value-driven assays

Translational Content
Fluorophore-conjugated analytes optimized for the immunohistochemical identification of infiltrating immune cells in tumors

Follow us, engage with us and challenge us to support your studies.

MPC-200
Multi-manipulator system

Versatile: User friendly interface controls up to two manipulators with one controller. Select components to tailor a system to fit your needs.

Expandable: Daisy chain a second controller and operate up to four manipulators with one input device.

Stable: Stepper motors and cross-rolled bearings guarantee reliable, drift-free stability.

Doubly Quiet: Linear stepper-motor drive reduces electrical noise. Thermostatically-controlled cooling fans barely whisper.

Make the right move!

Do what you never thought possible. With 5 interchangeable blocks, you can analyze from 1 to over 12,000 data points per run in any assay format that is right for your project. The QuantStudio™ 12K Flex system transforms the leading real-time PCR platforms into a single platform combining maximum throughput, scalability, and flexibility. Now, targeted discovery, confirmation, high-throughput screening, and everything in between, can be done on a single system.

See what the system can do at www.appliedbiosystems.com/quantstudio
proven qPCR performance is now within reach

The best-in-class qPCR platforms are also the best in value

Built on 20 years of industry-leading innovation, only the Applied Biosystems® real-time PCR portfolio offers a solution for every lab. From the simple reliability of the StepOne™ family to the unprecedented throughput of the QuantStudio™ 12K Flex system, no other lineup can match our flexibility, scalability, and performance.

SMALL ANIMAL IMAGING SYSTEM
The In-Vivo Xtreme is a new, multimodal imaging product dedicated to preclinical research. Beneath its sleek, contemporary design, Xtreme is powered by an innovative system architecture that provides the ultimate combination of sensitivity, speed, and flexibility to meet the most demanding challenges and broadest range of applications for molecular imaging. One of the most compelling features of this new system’s architecture is the ability to precisely match camera choice with research needs, performance criteria, and budget. Xtreme currently comes in two camera configurations. The front-illuminated 16 megapixel camera is ideally suited for applications that demand high resolution, while the back-illuminated 4 megapixel camera excels at very low light imaging experiments. With this uniquely flexible design, researchers will have the ability to upgrade their camera as new technology evolves and research requirements change. Xtreme comes with M1 Software, a powerful suite of tools for acquisition, visualization, and precise quantification of imaging data.

PCR SYSTEM
The Applied Biosystems QuantStudio 12K Flex Real-Time polymerase chain reaction (PCR) system is a highly versatile genetic analysis instrument that enables cost-effective and efficient interrogation of hundreds of target genes over thousands of samples in a single run. The growing demand for biomarker screening experiments, particularly in the early research phases of pharmacogenomics and agricultural biotechnology fields, has created a greater need for high throughput technology that can provide answers for researchers faster, more accurately, and at a reasonable price per reaction. The QuantStudio 12K Flex system addresses this with its ability to generate more than 12,000 high-quality, TaqMan data points per run, or up to 110,000 data points in an eight-hour workday. Users can also run digital PCR experiments on the instrument using nanofluidic consumables and dedicated analysis software for increased sensitivity and specificity.

Life Technologies

FTIR SPECTROMETER
The Fourier transform infrared (FTIR) spectroscopy instrument, FlowIR, is one of the smallest FTIR instruments on the market. FlowIR can be placed nearly anywhere along a reactor setup. The seamless integration of FlowIR into just about any home-built or commercially available flow chemistry synthesis system gives small-scale researchers control over flow reactions comparable to that of the largest manufacturing conglomerates—while allowing larger organizations to gather more data along complex multistep reaction chains. Because no special connections are required, FlowIR allows real-time flow chemistry monitoring at any point along a reaction chain. Multiple units along the reaction path in multistep synthesis setups give critical feedback to allow ongoing reaction adjustments. The enhanced control over potentially volatile reactions enhances safety. Typically, fewer experiments are also required, because reagents or other materials can be added as needed. This eliminates the need to perform reactions repeatedly and results in less material used.

Mettler Toledo
For info: 800-638-8537  |  www.mt.com

GENE TRANSFECTION
The magnefect-nano II is a new, compact device that offers gene transfection with improved efficiencies and cell viabilities, even with a range of difficult cell types such as neuronal and primary cells. It uses a unique technology applying proprietary magnet configurations and oscillating magnet arrays, which can operate at user-definable variable frequencies, to promote magnetic nanoparticle/DNA uptake into cells to improve nonviral gene transfection, while maintaining high cell viability. The device provides improved transfection efficiency and effectiveness over the best currently available cationic lipid agents at short transfection times (<30 minutes). It allows retransfection as well as adherent state transfection for user flexibility. It offers full flexibility with interchangeable 6-well, 24-well, and 96-well array formats and variable oscillating frequency capability to enable researchers to optimize protocols specifically for the cell types they are using.

HIGH THROUGHPUT CENTRIFUGE
The Allegra X-14 is a 3 L benchtop centrifuge that accepts a variety of tubes and adapters to provide reliable performance in a range of applications. Refrigerated and constant-temperature models are offered individually or in prepackaged bundles that provide everything needed for quick setup in the laboratory. With a fixed-angle rotor, the X-14 provides a maximum speed of 10,200 rpm and delivers rcf of 11,400 × g. Swinging-bucket rotors can achieve a maximum speed of 4,300 rpm and rcf of 4,300 × g and, utilizing a wide selection of tubes, bottles, and plates, can accommodate a range of sample types and volumes. Depending on rotor and labware, the Allegra X-14 can process as many as 148 tubes per cycle. The refrigerated model offers a temperature range of 2°C to 40°C and features a robust cooling system that brings samples from room temperature to 4°C in less than four minutes, reducing wait time and enabling runs to be processed efficiently. The constant-temperature model is preset to 20°C.
