COVER
False-colored scanning electron microscopy image of carbonate-silica “flowers,” each ~50 micrometers high. A vast array of similarly complex, well-defined microstructures can be sculpted by manipulating conditions such as pH, temperature, and carbon dioxide concentration. With insight into molecular growth mechanisms, these structures are dynamically steered toward arbitrary, hierarchically assembled architectures. See pages 822 and 832, as well as a slideshow online.

A. S. Gardner et al.

857 Inhibition of PRC2 Activity by a Gain-of-Function H3 Mutation Found in Pediatric Glioblastoma
P. W. Lewis et al.

862 Invasive Harlequin Ladybird Carries Biological Weapons Against Native竞争对手
A. Vilcinskas et al.

864 Nuclear Actin Network Assembly by Formins Regulates the SRF Coactivator MAL
C. Baarlink et al.

867 Wnt Stabilization of β-Catenin Reveals Principles for Morphogen Receptor-Scaffold Assemblies
S.-E. Kim et al.

871 Activation of the Yeast Hippo Pathway by Phosphorylation-Dependent Assembly of Signaling Complexes
J. M. Rock et al.

875 ATAXIN-2 Activates PERIOD Translation to Sustain Circadian Rhythms in Drosophila
C. Lim and R. Allada

879 A Role for Drosophila ATX2 in Activation of PER Translation and Circadian Behavior
Y. Zhang et al.

REPORTS

844 The contribution of glaciologists to sea level rise is nearly as much as that of the Greenland and Antarctic Ice Sheets combined.

845 Porous and dense piezoelectric films of α-quartz crystals are epitaxially grown on silicon substrates.

849 Complex solids are crafted through small changes to the solution conditions in a reaction-diffusion coupled system.

850 A computational imaging method is used to reconstruct a three-dimensional scene, without the need for lenses.

852 A method using extended building blocks is developed for computationally viable predictions of stable crystal structures.

853 The contribution of glaciers to sea level rise is nearly as much as that of the Greenland and Antarctic Ice Sheets combined.

857 Mutations of histones in some cancers result in inhibition of enzymes that lay down epigenetic marks on chromatin.

862 Invasive ladybugs harbor microsporidia that kill nonresistant beetles contributing to the original residents’ decline.

864 A dynamic polymeric actin structure inside the nucleus is part of the serum response in mammalian tissue culture cells.

869 The scaffold protein Axin has an active role in modulating signaling through the Wnt pathway.

871 A scaffold protein provides a two-step regulatory mechanism to control the exit from mitosis in yeast.

875 An epigenetic mechanism to control the exit from mitosis in yeast.

879 Fruit fly circadian clock function requires RNA-binding protein.
