The Lamont-Doherty Earth Observatory and The G. Unger Vetlesen Foundation are pleased to congratulate the 2015 Vetlesen Prize Laureate STEPHEN SPARKS for his ground-breaking work in the field of volcanology.

Professor Sparks is the Channing Wills Professor of Geology in the Department of Earth Sciences at the University of Bristol.

Kashmir has long been legendary as a destination of travelers from India and beyond. Ladakh is a trans-Himalayan kingdom that retains a strong Tibetan Buddhist identity with alpine desert valleys, watered by glacial melt where surrounding peaks display an astonishing geology. Join Dr. Chris Carpenter for an intriguing adventure! $5,495 pp + air

“YOU ARE WATCHING THIS BEAUTIFUL ECOSYSTEM BE DEGRADED BY CLIMATE CHANGE OR HUMAN INTERACTION … THEN YOU SORT OF PULL UP YOUR SOCKS AND GO SEE WHAT YOU CAN DO.”

Marine conservationist and Kenyan coral reef expert, Tim McClanahan, AAAS Member
RNA/Protein Detection Assay

The PrimeFlow RNA Assay is the first and only flow cytometry assay capable of simultaneous detection of RNA and protein within millions of cells at single-cell resolution. With the novel PrimeFlow assay, researchers can now incorporate the simultaneous analysis of RNA transcripts and proteins to elevate their understanding of single-cell dynamics. PrimeFlow RNA Assay enables high throughput detection of RNA and protein expression; therefore, it can be used to characterize, mechanistically and phenotypically, co-expression of RNAs with the functional proteins at the single-cell level. This assay, with a user-friendly protocol that has many similarities with standard antibody-staining procedures and data acquisition of flow cytometry, is an invaluable tool for immunology labs performing translational research. The major advantage of this technology is the ability to detect, with high sensitivity, mRNAs for which flow cytometry antibodies against the corresponding proteins perform poorly or are not available.

Gene Engineering System

The Dharmacon Edit-R Gene Engineering System is a novel platform for research which creates permanent and heritable gene disruption (knockouts) in cells utilizing the CRISPR-Cas9 gene engineering technology. Harnessing the natural defense mechanism of S. Pyogenes, the Edit-R platform comprises the three components required for gene editing in mammalian cells: (1) A plasmid encoding Cas9 nuclelease, (2) a chemically synthesized trans-activating RNA (tracRNA), and (3) a custom CRISPR RNA (crRNA) designed to target the site of interest. The Edit-R platform greatly simplifies and accelerates the experimental requirements and workflow compared to existing approaches.

Multiplex Amplicon Panels

An early access program is now available for Accel-NGS Amplicon Panels for use with Illumina Next Generation Sequencing (NGS) systems. The assays are compatible with FFPE and circulating cell-free DNA from 10 ng of genomic DNA. The underlying technology enables hundreds of primer pairs to be amplified in a single tube. The panels can be used to target either contiguous coverage of a single gene, multiple loci throughout the genome, or a combination of both. The initial product is a comprehensive TP53 panel, a clinically important tumor suppressor gene. This product covers all coding exons of TP53 in a single tube format. Another panel under development based on this technology targets over 200 clinically relevant oncology mutations. The multiplex amplicon panels achieve high-performance metrics, such as percent on-target and coverage uniformity. This new technology has a rapid workflow allowing identification of important mutations in a cost-effective manner.

Gene Capture Probes

xGen Predesigned Gene Capture Pools and Plates are ideal for creating customized target capture panels for enrichment of 10 or more genes or for enhancing the performance of existing panels. Predesigned Gene Capture Pools and Plates are ideal for scientists who need to reduce the cost of their next generation sequencing (NGS) experiments without sacrificing quality and specificity. xGen Predesigned Gene Capture Pools are available for the coding regions of any human RefSeq gene and are delivered premixed in tubes or in individual plate wells for selective mixing. NGS target capture technologies have previously been available mostly as either fixed, off-the-shelf probe pools, or panels that do not always meet experimental needs or expensive custom panels. With xGen Predesigned Gene Capture Pools and Plates, researchers and core labs can now generate relevant, custom gene panels in-house. This customization allows smaller starting volumes per panel, resulting in less waste.

Electronically submit your new product description or product literature information! Go to www.sciencemag.org/products/newproducts.dfl for more information.

Newly offered instrumentation, apparatus, and laboratory materials of interest to researchers in all disciplines in academic, industrial, and governmental organizations are featured in this space. Emphasis is given to purpose, chief characteristics, and availability of products and materials. Endorsement by Science or AAAS of any products or materials mentioned is not implied. Additional information may be obtained from the manufacturer or supplier.
Webinar

Now Available for On-Demand Viewing!
Recorded Live On: December 10, 2014

Untangling the tumor microenvironment
Illuminating the complex interactions and functions of immune cells

During the webinar viewers will learn about:

- Cutting-edge research targeting the B-cell receptor signaling pathway that has recently demonstrated therapeutic promise

- Methods that can provide in depth information on cancer phenotypes, including simultaneous immunohistochemistry of multiple biomarkers, multiplexed imaging, single cell quantitative analysis, and automated phenotyping

- How host-tumor interaction analysis in breast cancers could form the basis for assays to guide therapy and monitor response.

Certain antibody therapies have demonstrated the potential for directing a patient’s own immune system against tumors. Further advances in this area will depend upon a detailed understanding of the tumor microenvironment and characterization of the location and status of immune cells and their interaction with tumor cells. This will require methods that provide phenotyping of immune and cancer cells combined with information about their spatial relationship in tumor regions. Additionally, a deeper understanding of the signaling cascades active in immune recognition of cancers is crucial. During this webinar, we will discuss the bringing together of multiplexed fluorescent immunohistochemistry, advanced microscopy techniques, and bioinformatics, and how these are now enabling new insights into cancer biology and immunology.
