The Law’s Role in Promoting Economic Growth

Adrian Künzler draws on insights from the behavioral sciences to document the law’s role in stimulating new innovation and economic growth. His work involves developing a novel set of responses to problems of consumer sovereignty that will facilitate a more efficient exchange of information about consumer preferences relating to tangible product features, functions, and quality. In his research Adrian benefits from a five-year fellowship awarded by Society in Science. He is one of currently 38 outstanding postdoctoral researchers from around the world who have been selected as a Branco Weiss fellow.

AAAS Marion Milligan Mason Award for Women in the Chemical Sciences

Marion Milligan Mason was a chemist and a proud AAAS member. Her will provided for the creation of a fund with a $2.2 million bequest to support research by early-career women in the chemical sciences. AAAS is grateful for philanthropic gifts like Dr. Mason’s bequest, which make it possible for us to support promising scientists early in their careers.

The online application site will open November 16, 2015
Proposals are due on or before March 1, 2016
Awards will be announced on or before January 2017

Apply today!

Congratulations to the 2015 Recipients

ALISON FOUT
Assistant Professor of Chemistry
University of Illinois at Urbana-Champaign
Nitrite Reduction in a Non-Heme System: Evidence for an Alternative Mechanism

KATHERINE MACKEY
Assistant Professor, Department of Earth System Science
University of California Irvine
Aerosol Trace Metal Chemistry in a Changing Ocean

KRISTIN PARENT
Assistant Professor of Biochemistry and Molecular Biology
Michigan State University
Cryo-electron tomography of large and challenging biological specimens

LUISA WHITTAKER-BROOKS
Assistant Professor of Chemistry
The University of Utah
Exploration of scalable polymer-metal for thermoelectric applications

AAAS
ADVANCING SCIENCE, SERVING SOCIETY
Grand Challenge is an ambitious international research funding scheme offering a series of £20 million awards to solve cancer’s toughest questions. We’re looking for big, innovative ideas from interdisciplinary teams across the world.

Rise to the challenge
CRUK.ORG/GRANDCHALLENGE
Call closes 12th February 2016.
**Glycoprotein Column**
The new ACQUITY UPLC glycoprotein BEH amide 300 Å, 1.7-μm column enables biopharmaceutical companies to better understand where glycan molecules are located within the therapeutic proteins they are developing. Identifying the precise location of glycans within a protein structure is essential to delivering safe and effective biotherapeutic proteins. The novel, patent-pending ACQUITY UPLC ethylene bridged hybrid (BEH) amide technology assists scientists in obtaining reproducible glycan-related chromatographic and mass spectrometry (MS) information at the intact protein, fragment, or peptide levels. Designed to be used with Waters ACQUITY UPLC systems, this new glycoprotein analysis column provides unprecedented resolution using MS-compatible hydrophilic interaction liquid chromatography (HILIC) separations. Laboratories can now resolve different glycoproteins and glycopeptides, determine where both N-linked and O-linked glycans are located within the protein, and better understand glycan modifications and patterns. Combining these capabilities with mass spectrometric analysis provides far greater information about glycoprotein structure than has been previously available.

**Waters**

**mRNA Sequencing Preparation**
A new high-throughput single-cell messenger RNA (mRNA) sequencing workflow for the C1 system enables large-scale studies to characterize heterogeneous samples. This validated workflow includes a new advanced integrated fluidic circuit (IFC) and reagent kit that significantly increases throughput and ease-of-use, while simultaneously decreasing the cost of preparation and sequencing (by maximizing sequencer capacity) on a per-cell basis. The C1 mRNA Seq HT application is the first and only commercial product to address large single-cell studies and is available today. This new offering is a complete solution that enables scientists to deeply explore the diversity of cell subpopulations, quickly discover novel or rare cell types, and increase the statistical sample size to better estimate biological variation between similar cell types. The C1 mRNA Seq HT IFC can capture up to 800 cells at a time, and employs a new protocol to facilitate two runs (or 1600 cells) a day.

**Fluidigm**

**Automated Colony Counter**
The automated colony counter has now been improved. The industry-standard Scan range of counters have added a number of new features on all three models: the Scan 300, 500, and 1200. The level of automatic control has been increased, giving the user greater comfort. Now you can customize as many parameters as you want, eliminating the complicated batch settings and user input needed by other automated colony counters. The Scan 300, 500, and 1200 series are designed and built with the user in mind, and are compatible with the complete range of processes available in today’s laboratory. They work seamlessly with spiral platers and are compatible with DataLink traceability systems and robotic analysis chains. An upgrade to the image resolution of up to 1 megapixel brings enhanced imaging. It is now possible to count as low as 0.05 mm and obtain clear colony separation.

**Eikonix**

**Reference Standards**
A unique range of genetically defined, highly characterized HDx reference standards for immunohistochemistry (IHC) assays is now available. The introduction of IHC HDx reference standards provides histopathology laboratories with a consistent and reproducible source of reference material for the development and quality control of IHC assays. The independent external controls contain precisely defined protein expression levels presented on one slide, allowing scientists to easily determine the sensitivity of their assay. These standards are unique in having undergone a high level of characterization at a molecular and protein level, including quantitative digital pathology (QDP), to quantify the intensity of staining. The use of independent external controls enables consistency, reproducibility, and accuracy to be maintained and monitored across the laboratory workflow. IHC HDx reference standards are presented as formalin-fixed paraffin-embedded (FFPE) cell lines on slides arranged for particular target tumor types. Alongside every positive core there is also a negative protein expressing cell line core.

MERCK’S POSTDOCTORAL RESEARCH FELLOW PROGRAM

Join the Merck Networks for immediate news and recruitment alerts:

Bringing important medicines and vaccines to people around the world through innovative science is what we do. At Merck, we strive to improve human life, achieve scientific excellence, operate with the highest standards of integrity, expand access to our products and employ a diverse workforce that values collaboration.

Developing Talent, Harnessing Innovation, Building for the Future

Our Postdoctoral Research Fellow Program builds on our legacy of scientific excellence and innovation.

If you join us, you’ll be a part of a team of motivated scientists working to discover and develop medicines and vaccines that help meet the world’s unmet medical needs. You will work alongside outstanding researchers and collaborators as part of Merck’s industry-leading research and development organization. Our postdocs:

• Work in unique laboratory environments with top capabilities, equipment, expertise and knowledge
• Obtain experience in drug discovery and development
• Generate innovative science resulting in high-quality external publications
• Participate in seminars, lectures and meetings, and have the opportunity to interact with the local scientific community
• Are positioned for choice careers in pharma, biotechnology, or academia

As a postdoc, you will receive a competitive salary and access to the full benefits programs offered by Merck.

At Merck, our passion is improving health. This is what keeps us at the forefront of scientific discovery and innovation. We invite you to apply.

To learn more about the MRL Postdoctoral Research Fellow Program, or to apply for a position, visit www.merck.com/research/fellow/home.html or www.merck.com/careers.
Finding cures starts with research tools that actually work...

- Proteomic products and services
- Focused product portfolio
- Products tested for specificity and sensitivity
- Antibodies rigorously tested across a wide range of research applications
- Custom formulations
- GMP compliant ASRs*
- Bulk orders and lot reservations

* Custom formulations of certain monoclonal antibodies can be produced by CST in compliance with FDA regulations governing ASRs. Such products would be classified as Analyte Specific Reagents. Analytical and performance characteristics are not established. All other products are for Research Use Only. Not For Use In Diagnostic Procedures.
