Check out our brand new research Prize!

The Prize is a new highly competitive international prize which honors scientists for their excellent contributions to neuromodulation research. For purposes of the Prize, neuromodulation is any form of alteration of nerve activity through the delivery of physical (electrical, magnetic, optical) stimulation or chemical agents to targeted sites of the body.

For full details, judging criteria and eligibility requirements, visit:

www.sciencemag.org/prizes/pins

Submission Deadline: March 15, 2017
it's not you. it's your tools.

The right Western choices can take the “ugly” out of your next blot.

Western blotting tools from Merck help tailor your choices to your target:

- Ultradurable, tear-resistant TruPAGE™ precast gels
- Complete selection of PVDF and nitrocellulose membranes to help you make the right choice for transferring your protein of interest
- 30 minute immunodetection with the SNAP i.d.® 2.0 system for cleaner, more consistent data
- Ready-to-use reagents like the ultrasensitive Luminata™ substrate
- Application-specific antibody manufacturing expertise, with over 70,000 tested in Western blot

Show us your ugliest blots. We’ll provide tips and tricks for revealing beautiful Western data in our Protein Blotting Handbook, 6th edition.

σigma-aldrich.com/westernblot

P.S. If your blot has a big fingerprint in the middle...it might actually be you.
Lighting the way.™

Introducing Luna® Universal qPCR and RT-qPCR Products

New England Biolabs is pleased to introduce a bright, new choice for your qPCR and RT-qPCR. Luna products have been optimized for robust performance on diverse sample sources and target types. Available for dye-based or probe-based detection, Luna products can be used across a wide variety of instrument platforms. With so many qPCR and RT-qPCR options available, why not make a simpler, more cost-effective choice that delivers the sensitivity and precision you expect for your qPCR and RT-qPCR.

Visit LUNAqPCR.com to request your sample today.

RT-qPCR targeting human GAPDH was performed using the Luna Universal One-Step RT-qPCR Kit over an 8-log range of input template concentrations (1 μg – 0.1 pg Jurkat total RNA) with 8 replicates at each concentration. Reaction setup and cycling conditions followed recommended protocols, including a 10-minute RT step at 55°C for the thermostable Luna WarmStart® Reverse Transcriptase. NTC = non-template control.

One or more of these products are covered by one or more patents, trademarks and/or copyrights owned or controlled by New England Biolabs, Inc. For more information, please email us at gbd@neb.com. The use of these products may require you to obtain additional third party intellectual property rights for certain applications.
In extraordinary times, the American Association for the Advancement of Science (AAAS) must come together to advance science with particular force. This conviction is in the organization’s DNA. In 1851, AAAS’ third president Alexander Dallas Bache said, “While science is without organization, it is without power.” Now, as then, we must work together with renewed energy across the full spectrum of the scientific enterprise — and across the sectors that advance it.

The scientific enterprise embraces a broad spectrum of activities, from fundamental research to advanced applications. Academia, government, and industry all perform critical roles in moving ideas into innovations. The demands of the twenty-first century, including improved access to sufficient food, clean water, sustainable energy, and health care, can only be met by accelerating discovery and the translation of discovery into applications. Robust, sustained investments across the full spectrum of the scientific enterprise are essential for developing products that improve the human condition and drive economic growth. We can speed progress by amplifying collaboration across sectors and disciplines. What new avenues for interaction between basic and applied research might be explored? How can we encourage broader participation from every sector and demographic to meet today’s needs and to help invent the future?
Challenge your thinking with the leading online journal of high-impact, peer-reviewed translational research that matters most for human health.

Part of the Science family of journals, Science Translational Medicine publishes weekly and showcases findings on interdisciplinary topics driving preclinical and clinical applications, including immunology, cancer, infectious disease, drug discovery, genomic medicine, and bioengineering.

MADAGASCAR
Explore the Unique Heritage of this Enchanting Land!
October 7-22, 2017

Madagascar is the fourth largest island in the world and isolated from the African continent for 30 million years. It is home to at least 12,000 plants—a high percentage that are unique to the country with 95% of the lemurs and reptiles, 80% of the flowering plants, 98% of the palms, and more than 100 birds found nowhere else. This is an exceptional opportunity! $3,995 pp + air.

For a detailed brochure, call (800) 252-4910
All prices are per person twin share + air.

Multi-Tube Vortex Mixer
The TT-2500-VM Multi-Tube Vortex Mixer is designed to provide gentle to vigorous mixing of reagents at an adjustable speed of 500 rpm–2,500 rpm for up to 50 test tubes simultaneously. Packed with a range of features, the microprocessor-controlled unit has an easy-to-read LED display, a variety of available tube frames to hold different test tube sizes, and two built-in-operation modes that can be run either by short mixing or time mixing. The vortexing action is created by holding the top of the vessel securely in place and moving the bottom tray freely in a defined orbit. A DC brushless motor creates quiet and rattle-free mixing. The TT-2500-VM is ideal for use in high-throughput testing labs such as clinical, environmental, and chemistry labs.

Organoid Progenitor Cells
Cultrex Organoid Progenitor Cells, derived from normal, healthy mouse small intestine tissue, are now available and suitable for gene editing. These cells can be expanded using reduced growth factor BME-R1, and may be induced to express tissue-specific markers under differentiating conditions. Cultrex cells will be of particular interest to the large number of leading research groups worldwide that specialize in drug screening applications and use BME 2 organoid matrices. These cells are also ideally suited for use in common gene editing techniques such as CRISPR/Cas9 when developing models for infectious diseases and cancer, and also for studying the normal intestine. Organoid 3D cultures are extracted directly from living tissues similar to primary cultures. Instead of using an artificial, tissue culture–treated plastic environment, stem cell populations are maintained using an extracellular matrix environment under nondifferentiating conditions. When subjected to differentiating conditions, these organoids exhibit expression of tissue-specific genes and differentiation of stem cells into tissue-specific architecture.

GC Solution
The Agilent Intuvo 9000 gas chromatography (GC) solution offers users new, innovative technology that will help laboratories meet operational, scientific, and financial goals. Click-and-run connections eliminate ferrules, the Guard-Chip technology extends column life, and the trim-free column eliminates retention time shifts caused by column-trimming maintenance. With Intuvo Flow Technology chips and Smart ID keys, the Intuvo 9000 system self-identifies installed components and self-configures methods. Operations like mid-column backflush are made routine by eliminating complex setup and extra calculations. The touchscreen user interface provides quick access to system status and real-time data, and guides the user through routine maintenance operations. Connection via smartphone or tablet notifies laboratory managers remotely of system status. The new system, especially when coupled with mass spectrometry, is ideal for high-throughput contract laboratories and labs dealing with challenging sample matrices in fields such as food, environmental, chemical, pharma, and forensics testing.

SPE Sample Preparation
The Microlute SPE sample preparation system provides a fast, trouble-free alternative to cartridges for high-productivity sample cleanup. The Microlute system enables researchers to increase their assay sensitivity by providing reliable preinjection cleanup and concentration on samples as small as 150 μL. Supplied as a package including filter plate, collection plate, waste tray, and manifold, this system contains all the elements needed to deliver rapid and efficient solid-phase extraction (SPE) sample preparation in a convenient microplate format. Microlute SPE plates are available with a choice of sorbent, filter, and sample collection plates (350-μL, 1-mL, or 2-mL well volumes) to optimally match sample cleanup requirements. Using a proprietary sorbent-slurry loading technique, the plates have been developed to eliminate channeling effects that typically limit the performance of dry powder–loaded SPE columns. Each well on a Microlute plate has an individual drain spout ensuring 100% sample transfer and zero crossover contamination.

Epigenetic Assay Kits
A range of optimized chromatin immunoprecipitation (ChIP) assay kits are available for use in many areas of genome research, including classical quantitative PCR, DNA sequencing, and ChIP-seq sample analysis, using either discrete spin columns or dedicated 96-well filter plates. Chromatrap's solid-state ChIP technology has been shown by a growing number of research groups worldwide to be more efficient than conventional bead-based methods. Its solid-phase porous polymer, functionalized with either Protein A or G, provides a greater surface area for chromatin antibody binding with very low nonspecific binding. In addition, it uses a spin-column approach, offering significant speed, process, and carryover advantages over sepharose or magnetic beads. DNA pulldown with Chromatrap is up to 25 times greater than that achieved with conventional methods, while its signal-to-noise ratio for DNA enrichment is 2 to 3 times better, even with low chromatin samples between 50 ng to 3000 ng per immunoprecipitation.

Gel-Imaging System
HeroDoc Plus is a gel documentation system that many customers are finding checks all their boxes when it comes to the capture and imaging of gels and blots. The system is compact (40 cm × 52 cm) and easy to use. A fully protective, hinged UV screen enables viewing of the transilluminator surface for preparative work when the hood is open. For safety purposes, the UV protection screen will also switch off the UV light when it is in the up position. A scientific-grade CCD camera featuring a distortion-free megapixel lens with software-controlled motorized adjustment of sharpness and aperture further enhances the system’s capabilities. The mid-wave transilluminator has a new high-contrast filter peaking at 302 nm–312 nm, resulting in exceptional image quality. The 28 cm × 22 cm filter can accommodate a wide range of laboratory gels.
