CONTEMPORARY DETERRENTS TO THE PROCESS OF CLINICAL MEDICINE

INTRODUCTION.—It has been said that “Methods and view points rather than men determine periods in the history of medicine.” Following an era dominated by the study of structural pathology and of those physical signs expressive of structural change, there occurred a rather abrupt transition to a period characterized by investigation of the function of the various organs of the body in health and disease. Within the past fifty years there has been an increasing utilization of the sciences of chemistry, physics, biology, and mathematics, employed by investigators in their endeavor to measure function in exact ways, to estimate the degree of functional impairment in an organ diseased, to establish diagnosis upon a functional basis, and to institute therapy along lines calculated to prevent functional deterioration. By some, the contemporary period is termed “the golden age in medicine.” That period will have come more truly when there is a more appropriate correlation between functional impairment and structural change. Contemporary medicine has lost somewhat by its neglect of pathological anatomy.

This “functional” period in medicine has been marked by numerous well recognized trends. It has witnessed the development of an enormous number of laboratory tests and procedures. Many mechanical devices and instruments of precision have been introduced, designed to detect the slightest deviation from the so-called normal. The period has been associated with the sub-division of medicine into a great number of specialties, and a marked re-
