tation. The principal diffraction ring has a diameter of 4.05 cm. There is no evidence whatsoever of true fibering. The twenty-one-day sample pattern also shows continuous diffraction rings but these are sharper, indicating larger micellar size, that is, longer chains, and the diameter of the principal diffraction ring is 4.25 cm. The thirty-five-day sample pattern shows for the first time definite evidences of preferred orientation as indicated by greater intensity of the diffraction rings on the equator as compared with the poles of the pattern. The fibering, however, is still imperfect. The diameter of the principal diffraction ring is 4.50 cm. Finally, in the mature fifty-day fiber the pattern indicates the maximum degree of preferred orientation, the sharpest and narrowest diffraction maxima, indicating the final size of the micelles and a diameter of the principal diffraction ring of 4.60 cm. There has been thus a progression in these samples in fibering, in micellar size indicated by diffraction breadth and in the actual crystal unit cell dimensions as indicated by the interference ring diameters. The dimensions are largest for the youngest sample. This seems to indicate, therefore, a condition of intra-micellar swelling or of the fact that the primary valence chains are not oriented within the colloidal particle in a perfectly parallel fashion. It may also mean that the crystalline substance is not yet true cellulose. As the sample ages the diffraction ring increases in diameter, which means that the unit cell dimensions decrease until in the mature fiber the dimensions for ordinary cellulose are reached. It is evident that preferred orientation occurs some time between the twenty-first and thirty-fifth day, probably quite sharply. Further tests are now being made with samples showing finer gradation in growth.

Another series of samples of mature cotton fibers showing markedly different physical properties has been subjected to X-ray analysis and here again the diffraction patterns are equally striking in their differences. The samples consisted of a cotton of high quality, one whose fiber quality had apparently been lowered by adverse developmental conditions and a third which represented an inferior variety. In all three cases the diffraction rings have exactly the same measurements corresponding to true cellulose. The differences lie, first, in the degree of preferred orientation, and secondly, in the sharpness of the interference maxima. There is a marked difference in the degree of fibering which is maximum in the case of the first sample and minimum in the third. For example, the cords of the arcs on the diffraction rings produced by fibering have the following lengths: first, 2.8 cm; second, 3.25 cm; third, 3.8 cm. This gradation is exactly the same as that displayed by the qualitative differentiation. Furthermore, an examination of the sharpness of interferences indicates that the chain lengths in the colloidal micelles are greatest in the first sample and least in the third. Therefore, satisfactory physical properties are unquestionably connected with colloidal size greater than a critical value and in the best possible arrangement of these micelles with respect to the fiber axis itself. While these samples represent perhaps extreme conditions it seems very probable that it will be possible to classify cotton within much narrower limits and that the X-ray method will, therefore, prove an indispensable new tool both for specification and research in the cotton industry. A continuation of these studies in a quantitative manner is in progress.

Pure Proteins of Milk

VS.

Crude Casein

The pure proteins of milk are so difficult and expensive to prepare, that only too often the crude products are inadvisedly used in researches of importance.

One "crude essential element" of the diet may invalidate all other good features of a costly investigation, thereby disqualifying the deduction of the author.

In recent journals such papers have appeared.

"Crude Casein" of the usual industrial type represents simply an acid or rennet curd and is purely "Glorified Pot Cheese," containing unknown products of milk—in unknown amounts.

FOR RESEARCHES OF PRECISION

"Casein-Harris" and "Lactalbumin-Harris"

have been prepared

Through years of study in the Protein Laboratory of Osborne & Mendel (Yale Univ. & Conn. Expt. Sta.), we have learned how to prepare these two proteins in state of highest molecular purity.

Each protein contains highest nitrogen content, lowest mineral ash, freedom from each other and other substances of cow's milk.

They are made directly from fresh skim milk, which is the only possible way to prepare them in high purity.

Assayed upon growing white rats. Free from all vitamins.

Also Purest powdered Medicinal Yeast (standardized for Vitamines "B" (F & G)) and Concentrates from this yeast.

Also Vitamine factors, pure food mixes, deficient foods, salt mix and methods for Vitamine assays upon the Norwegian white rat.

THE HARRIS LABORATORIES

Tuckahoe New York
JOHNS HOPKINS UNIVERSITY
SCHOOL OF MEDICINE

The School of Medicine is an Integral Part of the University and is in the Closest Affiliation with the Johns Hopkins Hospital.

ADMISSION

Candidates for admission must be graduates of approved colleges or scientific schools with two years' instruction, including laboratory work, in chemistry, and one year each in physics and biology, together with evidence of a reading knowledge of French and German. Each class is limited to a maximum of 75 students, men and women being admitted on the same terms. Applications may be sent anytime during the academic year but not later than June 15th. If vacancies occur, students from other institutions desiring advanced standing may be admitted to the second or third year provided they fulfill the requirements and present exceptional qualifications.

INSTRUCTION

The academic year begins the Tuesday nearest October 1, and closes the second Tuesday in June. The course of instruction occupies four years and special emphasis is laid upon practical work in the laboratories, in the wards of the Hospital and in the dispensary.

TUITION

The charge for tuition for 1930-31 will be $600 per annum, payable in two installments. There are no extra fees except for certain expensive supplies, and laboratory breakage. Inquiries should be addressed to the Executive Secretary of the School of Medicine, Johns Hopkins University, Washington Monument Sta., Baltimore, Md.

Graduates in Medicine who satisfy the requirements of the heads of the departments in which they desire to work are accepted as students for a period not less than three quarters. Tuition charge is $30 a quarter.

BOSTON UNIVERSITY
SCHOOL OF MEDICINE
ORGANIZED IN 1873

ANNOUNCEMENT

may be obtained by application to

THE REGISTRAR
80 East Concord Street,
Boston, Massachusetts
The Wistar Institute Bibliographical Service

is of invaluable assistance to

Investigators—Librarians—Teachers

It brings to them, in AUTHORS' ABSTRACT form, a brief review of all original papers on Biological Subjects which appear in the following journals:

- Journal of Morphology and Physiology
- The Journal of Comparative Neurology
- The American Journal of Anatomy
- The Anatomical Record
- The Journal of Experimental Zoology
- American Journal of Physical Anthropology
- The American Anatomical Memoirs
- Folia Anatomica Japonica (Tokio, Japan)
- Stain Technology (Geneva, N. Y.)
- Physiological Zoology (Chicago, Ill.)

Publications of the Biological Survey of the Mount Desert Region

Advance Abstract Sheets

issued semi-monthly, bearing Authors' Abstracts without bibliographic references, offer a practical means of making research immediately available in abstract form and of purchasing articles of special interest in reprint form without the necessity of subscribing to all the journals. Subscription, $3.00 per year.

Bibliographic Service Cards

with complete bibliographic references, printed on Standard Library-catalogue cards, are of value and assistance to Librarians and Investigators. Subscription, $5.00 per year.

Abstracts in Book Form

Abstracts referred to above are brought together periodically in book form with Authors' and Analytical Subject Indices. Price $5.00 per volume, with liberal discount to regular subscribers to the Bibliographic Service Cards.

The Wistar Institute of Anatomy and Biology

---

**The New York Homeopathic Medical College and Flower Hospital**

Offers opportunity for highest grade medical training to one hundred men and women selected competitively.

In addition to thorough training in the Preclinical Sciences and the usual courses in Medicine and Surgery, special emphasis is given to Homeotherapy.

Seventy first annual announcement mailed to those interested.

450 East 64th Street

New York City

---

**Allegany School of Natural History**

In Allegany State Park, Quaker Bridge, N. Y.

Fourth Season—July 5 to August 23, 1930

Registration limited to fifty

Field studies in Botany, Zoology, Geology, Birds

Natural conditions favorable in richness and variety, suitable laboratories and equipment, comfortable living in a stimulating climate, guidance from experienced teachers and investigators.

Sponsored by the Buffalo Society of Natural Sciences, the New York State Museum, and the University of Buffalo (with college credit).

For circulars or registration, address until June 15:

DR. ROBERT E. COKER, Director

Chapel Hill, N. C.
