symptoms of adrenal insufficiency could be returned to normal by administering extract.

Recently we have completed a series of experiments in which the extract was tested on comatose animals prostrate and on the verge of death from adrenal insufficiency. The extract employed is a modification of the one previously described and is very low in adrenalin and solid content.

The cats were bilaterally adrenalectomized and allowed to develop very severe adrenal insufficiency symptoms. At the time of first injection of extract they were prostrate and unable to stand on their feet or move about, and so weak that if placed on their feet they promptly collapsed. The skin was cold and clammy and the rectal temperature down to 95°. The rectal temperature of normal or unilateral operated cats ranges from 101.4 to 102°. Adrenalectomized cats presenting the symptoms just described live but a few hours and death may occur at any moment.

By repeated injections of our purest preparations we have been able to revive such animals and return them to normal condition and to keep them in perfect health by daily injections. The body temperature, blood picture, appetite and strength return to normal.

It is a striking experience to one working with the animals to take a comatose cat with death imminent from adrenal insufficiency and by a few injections to revive it so that within seventy hours it has completely recovered and is running and playing about the laboratory apparently none the worse for its hazardous experience.

THE HORMONE OF THE ADRENAL CORTEX

In 1927¹ we first published a method for producing an extract of the adrenal cortex which would prolong the lives of totally adrenalectomized cats. Saturation of an acid extract with NaCl forms a precipitate which when dissolved and injected produces this effect. Heating the extract to 80° C. for five minutes destroys the active substance. The addition of ethyl alcohol to make 80 per cent. precipitates the proteins coagulable by heat and nitric acid but does not destroy the hormone.

We have long realized that the method of separating the hormone by salting out is unsatisfactory as a means of concentrating the active substance because with each precipitation so much is lost. We therefore have been working for some time with organic solvents.

The simplest method of preparing a concentrated extract of the hormone is to extract the cortex with ethyl ether. Removal of the ether by vacuum distillation is followed by extraction of the residue with 80 per cent. ethyl alcohol. The alcohol is removed in vacuo and the residue taken up with water to make the desired concentration.

Adrenalectomized cats treated with such an extract can be maintained in good condition for an indefinite period. Such cats allowed to go without extract until so weak that they can not sit up and appear near death have been revived by injections of this extract.

One cat had gone so far that she was lying prostrated, breathing rapidly and constantly twitching in various muscles of the body. She was expected to die before we could use remedial measures. Within an hour after injection of cortical extract the twitching ceased and the breathing became normal. Seventy minutes after injection she was sitting up. In ninety minutes she had recovered her strength and was eating.

In 1928² we named this hormone cortin. It is the substance essential to life found in the adrenal cortex.

BOOKS RECEIVED

DANTZIG, TOBIAS. Number, the Language of Science: Pp. x+260. Illustrated. Macmillan. $3.50.

McGraw-Hill Publications in the Zoological Sciences

A new text which features:
- A broad comparative point of view linking up cytology with embryology in a variety of chordate forms.
- Emphasis on the physiology of development.
- An attempt to interest the student in the subject for the sake of the subject itself.

An Introduction to
Vertebrate Embryology

By H. L. WIEMAN
Professor of Zoology, University of Cincinnati

411 pages, 6 x 9, more than 200 illustrations $4.00

The opening chapters deal with certain features of the study of protoplasm and are offered for the purpose of linking cytology with embryology. This presentation is paralleled by appropriate studies in the laboratory. The early development of Amphioxus and the frog are next considered together with reference to some phases of experimental embryology which have a general significance. Throughout the text an effort has been made to call attention to experimental work whenever practicable. The treatment of the chick embryo and the mammalian embryo, except in connection with difficult phases of the subject, is planned to complement the laboratory work rather than supplement it. The chapters on human embryology have no counterpart in the laboratory work,—the student's study of the pig embryo serving as the background for the discussion, which may also be supplemented by demonstrations.

Coming in August!

370 Seventh Avenue New York
Egyptian University  
FACULTY OF MEDICINE

Applications are invited for the newly created chair of Professor of Hygiene. Applicants must have a University Medical qualification and at least ten years' experience of Public Health work preferably in a Tropical Country. Candidates must have a recognized qualification in Public Health and preferably a qualification in Tropical Medicine and Hygiene. They must have held a teaching post in a recognized institution.

The duties of the Professor include giving a course of instruction to Undergraduates and a Postgraduate course for the Diploma of Public Health & Tropical Medicine. The language of instruction is English. He will also conduct research work.

The pay is L. E. 1500 per year. The post is on contract for three years renewable. The contract can be terminated by either side by three months' notice. One month's pay is given in lieu of traveling expenses to Egypt.

Applications accompanied by copies of Published Research and Testimonials are to be addressed to the Dean, Faculty of Medicine, Cairo, Egypt, not later than 15th September, 1930. Further details can be secured by application to the Dean.

If an Official of the Egyptian Government is selected for the post he will not receive the advertised salary unless it is sanctioned by the Financial Authorities.

The Wistar Institute  
Slide Tray

Section through two trays, showing nesting features

This tray will carry forty-eight 1-inch slides or thirty-two 1 1/4-inch slides, or twenty-four 2-inch slides. Ample space for high mounts, well protected from accident or dust. Trays nest together. Width and breadth the same, so that they may be nested in either direction. All metal—no paint or varnish to affect slides.

Price, $1.00 each

Orders may be sent to

THE WISTAR INSTITUTE

CARNEGIE INSTITUTION  
OF WASHINGTON

Publications of the Institution present in monographic form the results of its own research activities, and include a few books on other subjects.

Nearly 600 volumes have been issued, representing studies in the following fields:

- Archaeology
- Anthropology
- Astronomy
- Biology
- Botany
- Chemistry
- Ecology
- Economics
- Embryology
- Genetics
- Geology
- History
- Literature
- Mathematics
- Nutrition
- Paleontology
- Paleography
- Philosophy
- Physics
- Terrestrial Magnetism
- Zoology

Descriptive lists and prices may be obtained by addressing:

HAY FEVER

An Advertising Statement

HAY FEVER, as it occurs throughout the United States, is actually perennial rather than seasonal, in character.

Because in the Southwest—Bermuda grass, for instance, continues to flower until December when the mountain cedar, of many victims, starts to shed its pollen in Northern Texas and so continues into February. At that time, elsewhere in the South, the oak, birch, pecan, hickory and other trees begin to contribute their respective quotas of atmospheric pollen.

But, nevertheless, hay fever in the Northern States at least, is in fact seasonal in character and of three types, viz.:

TREE HAY FEVER—March, April and May
GRASS HAY FEVER—May, June and July
WEED HAY FEVER — August to Frost

And this last, the late summer type, is usually the most serious and difficult to treat as partly due to the greater diversity of late summer pollens as regionally dispersed.

With the above before us, as to the several types of regional and seasonal hay fever, it is important to emphasize that Arlco-Pollen Extracts for diagnosis and treatment cover adequately and accurately all sections and all seasons—North, East, South and West.

FOR DIAGNOSIS each pollen is supplied in individual extract only.

FOR TREATMENT each pollen is supplied in individual treatment set.

ALSO FOR TREATMENT we have a few logically conceived and scientifically justified mixtures of biologically related and simultaneously pollinating plants. Hence, in these mixtures the several pollens are mutually helpful in building the desired group tolerance.

IF UNAVAILABLE LOCALLY THESE EXTRACTS WILL BE DELIVERED DIRECT POST PAID SPECIAL DELIVERY.

List and prices of food, epidermal, incidental and pollen proteins sent on request.
