The results show that the majority of normal rats of either sex are right-handed. This discovery throws light on the phylogenetic evolution of handedness and at the same time overthrows the theory of outgrowth of human intelligence, the theory of primitive warfare and the theory of social tradition.

As to the heredity of handedness, the results in the literature are conflicting. Most investigators maintain that if handedness is hereditary at all, it does not seem to follow the Mendelian ratio. In order to study ten generations of human beings, a few hundred years are required. But with our discovery, we can attack the very same problem with better control in a short time.

As to the pathological significance of the problem, let us cite the following investigations. L. G. Smith found that among 2,055 school children, 4.5 per cent. of the girls and 5.5 per cent. of the boys were left-handed. Out of 500 delinquent, 6 per cent. of the girls and 11 per cent. of the boys; out of 200 feeble-minded, 11 per cent. of the girls and 8.5 per cent. of the boys were found to be left-handed. R. Gannet also reports that 21.9 per cent. of the epileptics and 18.7 per cent. of the feeble-minded are left-handed. In an earlier investigation, we found that normal rats are far superior in maze learning to those which have been depleted of vitamin B complex through their mothers’ diet during the nursing period. It is therefore of interest to find out the distribution of handedness among the vitamin B depleted rats. The results for the depleted animals are presented in Tables III and IV.

**TABLE III**

**HANDEDNESS IN VITAMIN B DEPLETED RATS**

<table>
<thead>
<tr>
<th>Handedness</th>
<th>Relative frequency in percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>27 males</td>
</tr>
<tr>
<td>Right</td>
<td>48</td>
</tr>
<tr>
<td>Left</td>
<td>48</td>
</tr>
<tr>
<td>Ambidextrous</td>
<td>4</td>
</tr>
</tbody>
</table>

**TABLE IV**

**HANDEDNESS IN VITAMIN B DEPLETED RATS EXCLUDING AMBIDEXTERTITY**

<table>
<thead>
<tr>
<th>Handedness</th>
<th>Relative frequency in percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Males</td>
</tr>
<tr>
<td>Right</td>
<td>50</td>
</tr>
<tr>
<td>Left</td>
<td>50</td>
</tr>
</tbody>
</table>

Comparison of the results indicates that the percentage of left-handedness is higher in the vitamin B depleted animals whose maze-learning ability was found to be much inferior to that of the normal rats. These results do not necessitate the conclusion that the left-handed are mentally inferior. They merely indicate that the percentage of left-handedness is higher among the poor learners, and that’s all. Perhaps when we study a group of geniuses, we may find that the percentage of left-handedness is also higher. Professor McCollum, of the Johns Hopkins University, suggested that we study the members of the National Academy of Sciences or the “Who’s Who in America.” Of course the left-handed person may or may not be a genius, but he has certainly proved to be a great star in the baseball game.

As to the psychological aspects of the problem, Tsai has studied the time required by the animal to change from the direct method of eating with mouth to the indirect method of eating “from-hand-to-mouth.” Also he has studied the amount of time required by each animal for making fifty consecutive attempts of hand movements a day. Both results, when plotted against five successive days, represent the abrupt curves of negative acceleration. As to the retention of hand-preference, he found that rats practically use the same hand after a month’s interval. As to the modification of hand preference, we have not done anything. However, the experiment can be very easily performed. First put a rat in the cage and find out whether he is left- or right-handed. If he is left-handed, the next time he uses his left hand again give him a mild electric shock. See how much training is required and how long he will continue to use the modified hand. Besides, modification may also be achieved by paralyzing the preferred hand either with drug or operation, and the changes be studied during and after recovery.

Available for Research—

Pure Proteins and Vitamine Products

MILK PROTEINS

The preparation of materials, of highest purity, for research studies, is so costly and involves such a loss of intellectual skill, this service is best rendered by American industrial laboratories, who specialize in such work.

Through years of experience in the laboratories of Osborne & Mendel (Conn. Expt. Station), we now produce the two chief proteins of milk, in state of very high purity.

Casein and Lactalbumin are prepared from fresh milk, which is the only way to obtain either one of these proteins, as pure substances.

“Casein-Harris” shows the following average analysis:

```
<table>
<thead>
<tr>
<th>Component</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moisture</td>
<td>10.73</td>
</tr>
<tr>
<td>Ash</td>
<td>.59</td>
</tr>
<tr>
<td>(Calcium, trace.)</td>
<td>13.66</td>
</tr>
<tr>
<td>Nitrogen</td>
<td>13.66</td>
</tr>
<tr>
<td>Ether-soluble</td>
<td>.20</td>
</tr>
<tr>
<td>(Calcium, trace.)</td>
<td></td>
</tr>
</tbody>
</table>
```

“Lactalbumin-Harris” shows highest nitrogen content, very low ash and the average analysis of the purest specimens of this protein.

Both of these proteins are free from all vitamins.

YEAST AND ITS VITAMINES

We claim to prepare the purest specimens of washed and dried yeast cells, available anywhere, for researches of precision.

Brewers’ Yeast-Harris (pasteurized powder), is prepared from a pure culture of fermentative yeast. The yeast cells are thoroughly washed with pure water to remove extraneous, soluble matter from its culture medium. The cells are quickly dried at temperature, just high enough to pasteurize the cells and to stop fermentation properties.

It is offered for chemical, nutrition and clinical purposes, where a pure yeast, with a known content of vitamine-B (F. & G) is desired.

CONCENTRATES OF VITAMINE-B (F & G)

Concentrated preparations from this yeast, containing Vitamine-B complex (F. & G), are also available for investigations. They contain more vitamine in proportion to total nitrogen content, than the whole yeast, and often serve such purposes in feeding experiments.

We also offer vitamines F. & G—“adsorbed” on Fuller’s earth—free from many extraneous substances of the whole yeast, as a “starting material” for further researches on vitamine-B complex.

“Autoclaved Yeast” is also offered, containing the anti-pellagric G vitamine (heat-stable) and free from anti-neuritic Vitamine-F, which is heat-labile. This product is standardized by the white rat method and growth charts are available with it.

A College Textbook for Non-Medical Students

From his own experience in teaching hygiene to non-medical students, Dr. Whitman has found a real need for an intermediate textbook in this subject—one that is not so bulky and technical as those written primarily for medical students, and yet is not too elementary and limited in scope to be suitable for university courses. In his new book, "Hygiene," the author aims to bridge this gap. He presents a text that is detailed without being too technical, that stimulates the student to think and to reason for himself rather than to accept the ready-made opinions of others, and one that is a practical exposition of the problems with which the layman is most likely to meet in everyday life. The book is general in scope. Dr. Whitman has not confined his treatment to any particular field of hygiene such as personal or public hygiene or epidemiology, but has selected the most important phases of each. The author believes that a knowledge of technical terms is quite as essential in this subject as it is in botany, zoology, chemistry, etc. He has therefore included most of these terms, but has given sufficient definitions along with them to relieve the reader of the burden of looking them up in the dictionary. The nature of protoplasm as the physical and chemical basis of life, and a short discussion of the nature of disease processes are treated in a few chapters to give a general background to the reader who has not had a thorough foundation in biology, physics, chemistry, anatomy, etc. Heredity and eugenics have been given considerable emphasis in this text.

CONTENTS

Introduction; Health and Disease; The Physical and Chemical Basis of Life; Death; On the Nature of Disease; Endogenous Causes of Disease; The Hereditary Diseases of Man; The Problem of the Defective; Defects of Character, Mental Hygiene; Eugenics; The Exogenous Causes of Disease; The Air; Carbon Monoxide; Light: Food and Exercise; Food Poisoning and the Diseases Transmitted by Them; Water; Milk; The Morphology and Physiology of Bacteria; The Mechanism of Infection; Immunity; Dissemination of Bacteria, Portals of Entry; Methods of Control; Small-pox and Hydrophobia; Tuberculosis; The Pneumonias and Influenza; Diphtheria; Whooping Cough, Scarlet Fever and Measles; The Water-Borne Diseases; The Insect-Borne Diseases of Man; Infections Associated With the Soil, The Anaerobes; Sectarian Medicine.
