appendiculatus) undertaken at the invitation of the colonial secretary, Lord Passfield, acting for the Government of Kenya, and on the recommendation of Sir Arnold Theiler. The experiments were conducted in the Government Laboratories at Kabete near Nairobi. To both the director of agriculture, the Honorable Alexander Holm, and the chief of the Veterinary Research Laboratory, Mr. James Walker, we wish to express our thanks for many courtesies. We are grateful also to Mr. R. Daubney, who was acting chief of the laboratory during a part of our stay in Kabete; to Dr. E. A. Lewis and to Mr. W. B. C. Danks, both of whom helped us in the actual conduct of our experiments.

The observations were made on six principal series of ticks: (1) Infected as larvae; (2) control, fed on a clean animal as larvae; (3, 4 and 5) infected as nymphae; (6) control, fed on a clean animal as nymphae. They were complicated and difficult for three reasons. First, because in some cases only a relatively small percentage of ticks fed on blood containing parasites retain them throughout their life cycle. Second, the uniform presence of symbionts was a confusing factor in the study of smears soon after engorgement. Lastly, the large majority of the ticks, both infective and clean, contained a protozoan parasite, different from that of East Coast fever, with multiplicative phases in the macrophages in the tick's body and to a lesser extent within the intestinal epithelial cells. All the animals used for the feeding of ticks were carefully reared and free from other tick-borne diseases.

We have found that the life cycle of Theileria parva in ticks is divisible into the following stages:

1. Emigration of parasites from the red blood cells into the gut of the tick begins soon, but parasites may remain in the red blood cells for as long as six days after the ticks drop off engorged.

2. In the lumen of the gut what appear to be male and female forms are distinguishable, and further examination of the material collected may show that it is here that conjugation takes place.

3. Many of the free forms in the gut are destroyed in situ; others are taken up by the intestinal epithelial cells and digested within them in association with digestive spherules; still others penetrate intestinal epithelial cells, which are not provided with digestive spherules, and grow.

4. These intra-epithelial parasites make their appearance about the sixth day. From the sixth to the twenty-third day their diameter increases approximately five times. They are recognizable up to the thirty-first day, that is to say over the period of moulting which was accomplished in the several infected series on the twenty-fourth, twenty-fourth, twenty-fourth and eighteenth days after engorgement.

5. From the day before moulting through the actual moulting and as late as the thirty-first day these intra-epithelial forms change into motile Euglenia-like forms. These Euglenoids penetrate the wall of the intestine and enter the body cavity. They make their way to the salivary glands, where they may be seen in contact with the cells. They were last detected in the four series on the thirty-third, thirty-fourth, thirty-fifth and twenty-ninth days, respectively.

6. Over a period of several days after their formation the Euglenoids enter the salivary gland cells. Their entry was not observed in the larval series, but in the three series of nymphae they were seen as early as the twenty-fifth, twenty-third and twenty-second days.

7. Once within the salivary gland cells the Euglenoids rapidly change into deeply staining spore-like structures, which increase in size to form mulberry-like masses. The peripheral swellings on the mulberries give rise to small forms of the parasite which resemble closely those first observed in sick animals. This is the condition of the parasite usually seen in the salivary glands at the time that the next feeding began on the thirty-third, thirty-sixth, thirty-fifth and twenty-ninth days after engorgement.

8. During the first four days of feeding the small forms increase greatly in number at the expense of the mulberry-like masses. Many of them are discharged into the lumina of the salivary acini, but some were still seen in ticks as late as the twelfth day after attachment.

The bites of ticks belonging to the series containing these parasites in their salivary glands produced East Coast fever in susceptible animals, whereas those of the control, clean ticks which did not possess parasites failed to do so.

The latest text in the

*McGraw-Hill Euthenics Series*

**CHEMISTRY AND COOKERY**

By Annie Louise MacLeod

*Dean of the College of Home Economics*

*Syracuse University*

and Edith H. Nason

*Professor of Foods, Syracuse University*

545 pages, 5½ x 8, illustrated

$3.50

A CONCISE and readable presentation of the present-day chemical theory and its application particularly to the study of foods. The fundamentals of chemistry are developed from the electronic point of view in such a way as to reduce the memorization of unrelated facts to the minimum and replace this by the habit of deductive thinking.

The illustrative material is chosen with the experiences most familiar to women always in mind. The connection between chemical theory and practical cookery problems is clearly made.

Two Other Recent Books in the Series are:

**Arlitt's** Psychology of Infancy and Early Childhood—

*New Second Edition*

By Ada Hart Arlitt, Professor of Child Care and Training, University of Cincinnati. 382 pages, 5½ x 8, 16 illustrations. $3.00

Dr. Arlitt surveys in this book the physical and mental make-up of the child. The senses and emotions, the methods by which these can be disciplined and controlled, and the processes of conditioning and reconditioning habit formation.

**Osborn's** Physics of the Home—

*New Second Edition*

By Frederick A. Osborn, Professor of Physics, University of Washington. 400 pages, 5½ x 8, 221 illustrations. $3.00

A textbook for home economic students in normal schools, colleges and universities. It presents a thorough discussion of those principles of physics that apply to household work.

AN UNPRECEDEDNTED OFFER!

THE NEW SCIENCE SERIES

The most eminent men of our day have written these books. A specialist in each field of science explains, in non-technical language, the latest developments in his field. The authors include men like T. H. Morgan, President of the American Association for the Advancement of Science; Stefansson, the noted Arctic explorer; John B. Watson, founder of Behaviorism; William Morton Wheeler, Entomologist; Malinowski, distinguished Polish anthropologist.

Complete list of titles:

1. Myth in Primitive Psychology
   By Bronislaw Malinowski.
2. Science and Poetry
   By I. A. Richards.
3. Fatalism or Freedom
   By C. Judson Herrick.
4. A Short Outline of Comparative Psychology
   By C. J. Warden.
5. Types of Mind and Body
   By E. Miller.
6. The Father in Primitive Psychology
   By Bronislaw Malinowski.
7. The Standardization of Error
   By Vilhjalmur Stefansson.
8. Economics and Human Behavior
   By P. Sargent Florence.
9. Culture, The Diffusion Controversy
   By G. Elliot Smith, Bronislaw Malinowski, Herbert J. Spinden, Alexander Goldenweiser.
10. Intelligence and Mental Growth
    By C. A. Claremont.
11. Emergent Evolution and the Development of Societies
    By W. M. Wheeler.
12. Science and History
    By A. L. Rowse.
13. Man a Machine
    By Joseph Needham.
14. The Alchemy of Light and Color
    By Oliver L. Reiser.
15. The Basis of Memory
    By W. R. Bousfield.
16. What is Darwinism?
    By Thomas Hunt Morgan.
17. The Battle of Behaviorism
    By John B. Watson and William MacDougall.
18. Prodigal Sons or the Evolution of Caste
    By Montgomery Evans.
19. The Conquest of Thought by Invention
    By H. Stafford Hatfield.
20. The Future of the Earth
    By H. Jeffreys.
21. Sociology and Sin
    By P. Sargent Florence.

SPECIAL OFFER

The volumes in the New Science Series are uniform in size and format, 4½” x 6½”, bound in blue cloth, stamped in red. Not pamphlets. Each is about ½ inch thick. Convenient for pocket or library.

Each title originally sold for $1.00 a copy. Now we are making the special offer to readers of this magazine—ALL 21 BOOKS FOR $5.00, if you use the coupon below. They originally cost $21.00 for the set.

If you prefer to order separate titles, you can get them, by using the coupon below, at the rate of $1.00 for three books. No orders for less than three books accepted.

THIS COUPON IS WORTH $16.00

W. W. NORTON & COMPANY, INC.
70 Fifth Avenue, New York

( ) Please send me, postpaid, the complete set of 21 volumes in THE NEW SCIENCE SERIES at $5.00.

( ) Please send me volumes numbered at $1.00 for three volumes.
