

in thickness, rests with disconformable contact on the Domengine horizon of the Eocene and is conformable with the overlying Vaqueros marine beds of Lower Miocene age. Greenish and maroon shales and sandstones which are particularly characteristic of a conveniently recognizable middle division of the Sespe in the Simi anticline have yielded vertebrate remains. Occurrences of fossil mammals range vertically in the section from approximately 1,600 feet to 3,000 feet above the contact with the Eocene. The fauna includes *Paramys*, a creodont, insectivores, bunoselenodont artiodactyls, an agriochoerid, *Epitriplopus* (?), an amynodont and titanotheres. Some of the more important features of the discovery of this assemblage are: (1) The earliest Tertiary record of land mammals thus far known on the Pacific Coast; (2) the occurrence offers opportunity to establish on the basis of vertebrate paleontology the time relationships of the early Tertiary portion of the stratigraphic column of the Coast Ranges to the continental sequence as determined in the Rocky Mountains and western Great Plains; (3) several mammalian types in the fauna are structurally more advanced than related forms of the Upper Uinta Eocene and are evidently more primitive than forms known from the White River Oligocene; (4) added information is available concerning the geographic distribution of some early Tertiary mammals in North America.

*Observations on individual growth:* FRANZ BOAS.

*The significance and inheritance of leg-length in dogs:* CHARLES R. STOCKARD.

*Conceptual categories in primitive languages:* EDWARD SAPIR (introduced by C. Wissler). The relation between language and experience is often misunderstood. Language is not merely a more or less systematic inventory of the various items of experience which seem relevant to the individual, as is so often naïvely assumed, but is also a self-contained, creative symbolic organization, which not only refers to experience largely acquired without its help but actually defines experience for us by reason of its formal completeness and because of our unconscious projection of its implicit expectations into the field of experience. In this respect language is very much like a mathematical system, which, also, records experience, in the true sense of the word, only in its crudest beginnings but, as time goes on, becomes elaborated into a self-contained conceptual system which pre-visages all possible experience in accordance with certain accepted formal limitations. Such categories as number, gender, case, tense, mode, voice, "aspect" and a host of others, many of which are not recognized systematically in our Indo-European languages, are, of course, derivative of experience at last analysis, but, once abstracted from experience, they are systematically elaborated in language and are not so much discovered in experience as imposed upon it because of the tyrannical hold that linguistic form has upon our orientation in the world. Inasmuch as languages differ very widely in their systematization of fundamental concepts, they tend to be only loosely equivalent to each other as symbolic devices

and are, as a matter of fact, incommensurable in the sense in which two systems of points in a plane are, on the whole, incommensurable to each other if they are plotted out with reference to differing systems of coordinates. The point of view urged in this paper becomes entirely clear only when one compares languages of extremely different structures, as in the case of our Indo-European languages, native American Indian languages and native languages of Africa.

*The genesis of cerebellar tremor and its disappearance after removal of the cerebral hemispheres:* J. F. FULTON (introduced by Yandell Henderson). One of the most striking locomotor disturbances encountered in the field of clinical neurology is the tremor associated with lesions of the cerebellum. Though recognized as the essential symptom of cerebellar deficit as early as 1824 (Flourens), its nature has remained obscure. We have therefore focused our attention upon the genesis of tremor following removal of the cerebellum (cats, dogs, monkeys and baboons) and have found that in the cat it does not appear until the fourth to the seventh day after the operation. Simultaneously with the appearance of the tremor, the animal commences to execute voluntary movements. In other animals in which tremor appears sooner, it is always coincident with the return of voluntary activity. Since the cerebellum had been removed the question arose as to what part of the nervous system was responsible for the tremor. On removal of one cerebral hemisphere in the decerebellated animal the extremities of the opposite side become rigid but continue to show associated movements unaccompanied by tremor. When the second cerebral hemisphere is removed, thus making a decerebellated thalamic preparation, great locomotor activity is seen in all extremities, but tremor is completely absent. We have thus far succeeded in keeping preparations of this character under observation for periods varying from one to three weeks. Further observations are being made on primates, in which the relation of the neocerebellum to the motor cortex is being studied. We conclude that cerebellar tremor is a phenomenon resulting from inadequate compensatory action of the cerebral hemispheres.

*The rate of trophic impulses in nerves of cold-blooded vertebrates:* G. H. PARKER and V. L. PAINE. The lateral-line nerve of the catfish transmits sensory impulses in one direction and trophic impulses in the opposite. The rate of transmission of the trophic impulses is very slow, approximately two centimeters per day.

## SNOW CRYSTALS and Kindred Water Forms

by W. A. Bentley and W. J. Humphreys  
230 pages, 9 x 12, \$10.00

FROM Jericho, Vermont, for more than forty years, through the patience and skill of W. A. Bentley, have gone out many exquisite pictures of the snow crystal. And from far and wide has come back the urgent request that these pictures be somehow preserved from an otherwise sooner or later certain loss and made conveniently available alike to the scientist seeking truth, the artist searching for patterns of graceful form, and all to whom the beautiful in nature has a strong appeal.

Now, through the sponsorship of the American Meteorological Society this has been done and over 2000 of Mr. Bentley's collection of 5300 microphotographs have been selected, classified and beautifully reproduced in this book.

Here is a book that represents a distinctive service to students of meteorology and crystallography. In the classification of the forms and his comments on them, W. J. Humphreys has pointed out the significant facts of interest to the scientist, the procedure of making the photos, circumstances of occurrence, notes on classification, etc. To the artist the photographs themselves are paramount. Inspiration is here, and a challenge—in more than 2000 designs, no two alike, and all adapted to a single unit form.

### Part I—Snow Crystals

History—Taking the Snow Crystal's Picture—Some Facts of Observation—Classification—Circumstances of Occurrence—Markings—Shapes of Cavities—Parasitic Crystals—Picture Crystals—Crystallography of the Snow Crystal—Peculiar Crystals—Partial Bibliography of the Ice Crystal.

### Part II—The Snowflake's Closest of Kin and its Cousin, the Dewdrop

Ice Flowers—Windowpane Frost—Dew and Frost—Rime—Glaze—Sleet—Graupel.

# Outlines of Theoretical Chemistry

•

**By Frederick H. Getman**

Formerly Associate Professor of Chemistry, Bryn Mawr College

**Revised by Farrington Daniels**

Professor of Chemistry, University of Wisconsin

*Previous Editions Used in 280 Colleges & Universities*

First published in 1913, this well-known textbook in Physical Chemistry now appears in a thoroughly revised fifth edition. It is designed to meet the requirements of classes beginning the study of theoretical, or physical chemistry. However, scientists in other fields, anxious to keep abreast of the new developments in a rapidly moving field, will find in the new "Getman-Daniels" a wealth of important information on every major aspect of the subject.

In the words of Dr. Daniels this new edition "introduces recent advances without offending old friends who cherish the foundations of a successful past; keeps pace with present tendencies toward the mathematical viewpoint without driving away students who are inadequately prepared; and sifts out the permanent from the trivial."

Some of the many changes incorporated in this fifth edition are: throughout the book, a special effort has been made to amplify or change those portions of the book which have been found troublesome. The chapters on Elementary Thermodynamics, Kinetics, Photochemistry and Atomic Structures have been rewritten. New chapters on Chemical Thermodynamics and an Introduction to the Quantum Theory have been added as these fields have become so important that even elementary students should have some acquaintance with them. The first half of the book has been made simpler, and the last half somewhat more advanced. Many new problems have been added.

◆

**ANNUAL SURVEY OF AMERICAN CHEMISTRY.** Edited by CLARENCE J. WEST, Chairman of the Committee of the Division of Chemistry and Chemical Technology of the National Research Council. **Volume V, 1930. 630 Pages. \$5.00.**

This well known review presents to the reader a concise and accurate survey of the progress in pure and applied chemistry made in America for the calendar year 1930. Every chemist should have a complete set of these volumes to keep abreast of modern scientific and technical developments in America irrespective of whether he is engaged in industry or professional work, and to point the way for a more exhaustive reading in fields in which he is especially interested. *Series to date: Volume I, \$2.00; Volume II, \$3.00; Volume III, \$3.00; Volume IV, \$4.00.*

◆

**THE VITAMINS.** By H. C. SHERMAN and S. L. SMITH. 2nd Edition, entirely rewritten. **A. C. S. Monograph No. 6. 525 Pages. Ill. \$6.00.**

This monograph undertakes to treat its field both broadly and thoroughly, each of the six vitamins now generally recognized being discussed in its various aspects—the physical properties, the evidence as to purely chemical nature, the biological relationships and occurrence in nature, the methods of determination, the distribution in foods, and the significance as a factor in food values and in relation to nutrition and health. ¶ The volume is thus designed to serve agriculturists, biologists, chemists, dietitians, food manufacturers and their technologists, home economics and nutrition workers, physicians, teachers, and many other readers interested in the present-day development of science and in the problems of food and health. To many students in this varied field, the bibliography alone may well be worth the price of the book.

◆

**DIELECTRIC CONSTANT AND MOLECULAR STRUCTURE.** By CHARLES PHELPS SMYTH. **A. C. S. Monograph No. 55. 224 Pages. 31 diagrams. \$4.00.**

This New Book of far-reaching importance in a new field of very general interest makes available to the physicist, the chemist and the chemical engineer the result of many recent investigations, showing the success of a new method of attack upon the molecule and describing methods for further prosecution of attack.

◆

**NUCLEIC ACIDS.** By P. A. LEVENE and LAWRENCE W. BASS. **A. C. S. Monograph No. 56. 337 Pages. \$4.50.**

Up-to-date information with experimental details for selected synthetic and analytical methods in the fields of pyrimidine, purine, and nucleic acid chemistry for the chemist, biologist, physiologist, and physician. In addition to the text, the book contains an extraordinarily comprehensive bibliography arranged and set up in a manner which makes it exceedingly easy and practical to use.

◆

**COLLOID CHEMISTRY; THEORETICAL AND APPLIED. Volume III, Technological Applications.** Edited by JEROME ALEXANDER. **655 Pages. \$10.50.**

The forty-two papers by distinguished investigators included in this volume touch directly or indirectly many phases in the development of processes and products of industry. The first eleven papers consist of subjects of interest to many industries and deal with general principles. Six papers immediately following deal with mechanical or more specialized matter. The balance of the papers will prove an invaluable aid for the selection and application of those principles of colloid chemistry to specific branches of science beginning with geology and mineralogy and running to metals, petroleum, asphalt and agriculture. *Series to date: Volume I, Theory and Methods, 974 Pages, \$14.50; Volume II, Biology and Medicine, 1029 Pages, \$15.50.*

◆

**THE STRUCTURE OF CRYSTALS.** By RALPH W. G. WYCKOFF. 2nd Edition entirely rewritten. **A. C. S. Monograph No. 19. 497 Pages. Ill. \$7.50.**

This new edition follows closely the form of its first edition and marks the advances already reached in the study of Crystal Structure in the light of x-ray diffraction methods. The progress of the last few years has been so great and important that nearly every chapter has been entirely rewritten.
